

B29C

SHAPING OR JOINING OF PLASTICS; SHAPING OF MATERIAL IN A PLASTIC STATE, NOT OTHERWISE PROVIDED FOR; AFTER-TREATMENT OF THE SHAPED PRODUCTS, e.g. REPAIRING (making preforms [B29B 11/00](#); making laminated products by combining previously unconnected layers which become one product whose layers will remain together [B32B 37/00](#) - [B32B 41/00](#))

Definition statement

This place covers:

Processes and apparatus for:

- shaping or joining of plastics;
- shaping of material in a plastic state when a specific material is not identified;
- shaping of material in a plastic state, not otherwise provided for.

Products obtained by processes provided for in this subclass, as long as the products are characterised by said processes.

Relationships with other classification places

Subclass [B29C](#) is often connected with the following areas:

- [B29B](#), related to preparation or pre-treatment of the material to be shaped, making granules or preforms, beyond recovery of plastics or other constituents of waste material containing plastics;
- [B29D](#), related to processes and apparatus for the production of particular articles characterised by their global structure, e.g. flat, hollow, or tubular articles, by their structural features, e.g. provided with screw threads, corrugations, grooves or projections, or by their purpose, e.g. buttons, optical elements, tyres or footwear. Attention should be paid to [B29](#) note (3), i.e. classification according to production of particular articles in subclass [B29D](#) is restricted to:
- aspects which are characteristic for the production of a particular article, and not classifiable in subclass [B29B](#) or [B29C](#);
- combined operations for making the particular article which are not fully classifiable in subclass [B29C](#); [B29C](#);
- [B32B](#), related to layered products (products built-up of strata of flat or non-flat, e.g. cellular or honeycomb form) as well as methods or apparatus for making layered products;
- [C08J](#), related to chemical aspects or features for treating, compounding, working-up or recovery of macromolecular substances not covered by subclasses [C08B](#), [C08C](#), [C08F](#), [C08G](#) or [C08H](#);
- [C08K](#), related to the use of inorganic or non-macromolecular organic substances, or mixture thereof, as additives in composition of macromolecular compounds;
- [C08L](#), related to composition of organic macromolecular compounds, such as polysaccharides and derivate, rubbers and derivate, macromolecular compounds obtained by reactions involving or not carbon-to-carbon unsaturated bonds, natural macromolecular compounds and derivatives.

Manufacture of artificial filaments, threads, fibres, bristles or ribbons	D01D , D01F
Manufacture of articles from cellulosic fibrous suspensions or from papier-mâché	D21J

Special rules of classification

In this subclass, the following rules must be applied:

- The working of plastics is, as far as possible, classified primarily according to the particular shaping technique used in this subclass;
- Combined operations for making a particular article which are not fully classifiable in this subclass must be classified in subclass [B29D](#).

Special rules of classification

Products per se are not classified in this subclass. However, if a product is characterised by the way it is produced and not by its structure or composition, the production method should be classified in this subclass. In this subclass:

- repairing of articles shaped or produced by using techniques covered by this subclass or subclass [B29D](#) is classified in group [B29C 73/00](#);
- component parts, details, accessories or auxiliary operations which are applicable to more than one moulding technique are classified in groups [B29C 31/00](#) - [B29C 37/00](#);
- component parts, details, accessories or auxiliary operations which are only applicable or only of use for one specific shaping technique are classified only in the relevant subgroups of groups [B29C 39/00](#) - [B29C 71/00](#).

In this subclass, it is desirable to add the indexing codes of subclasses [B29K](#) and/or [B29L](#).

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

A plastic	is a macromolecular compound or composition based on such a compound
In a plastic state	refers to a state in which the material is more or less easily deformable, locally or as a whole, by force in any direction, to assume and retain any desired shape.

Synonyms and Keywords

In patent documents, the following abbreviations are often used:

Resins	Japanese patent applications usually refer to resins instead of plastics
--------	--

B29C 31/00

Handling, e.g. feeding of the material to be shaped {, storage of plastics material before moulding; Automation, i.e. automated handling lines in plastics processing plants, e.g. using manipulators or robots (discharging moulded articles from the mould [B29C 37/0003](#); storage of prepregs or SMC after impregnation or during ageing [B29C 70/54](#); baling of rubber [B29B 15/02](#)}}

B29C 33/00

Moulds or cores; Details thereof or accessories therefor

Definition statement

This place covers:

Moulds or dies being the tool used to shape the plastic parts in moulding processes in its desired form. A mould typically comprises a cavity to shape a plastic part.

Rolls used in continuous moulding processes

Making of moulds

Designing moulds.

Relationships with other classification places

The scope of [B29C 33/00](#) is limited to moulds for shaping substances being in a plastic state

Moulds for shaping other substances are not covered by this class, but by the class in their field of application

References

Limiting references

This place does not cover:

Moulds for making tyres	B29D 30/0606
-------------------------	------------------------------

Informative references

Attention is drawn to the following places, which may be of interest for search:

Moulds for pressure die casting	B22D 17/22
Moulds for shaping clay or other ceramic products	B28B 7/34

Special rules of classification

Moulds specific for a single moulding technology are classified in that technology: e.g. moulds for injection moulding [B29C 45/26](#), moulds for blow moulding [B29C 49/48](#).

Since the classification scheme present in [B29C 45/00](#) is much more detailed, for reasons of search efficiency, classification in [B29C 45/00](#) is preferred above a classification in [B29C 33/00](#) in the case that both classifications would be applicable.

Synonyms and Keywords

In patent documents, the following words/expressions are often used as synonyms:

- "Mould", " mold" and "die"

Manufacture of films or sheets	C08J 5/18
Encapsulation, potting and similar processes used in electronics	H01L 21/56 , H01F 41/005 , H01F 41/127 , H01L 23/28 , H05K 3/284 , H05K 3/101

Synonyms and Keywords

In patent documents, the following words/expressions are often used as synonyms:

- "casting", "moulding", "pouring", "potting" and "encapsulating"

B29C 41/00

Shaping by coating a mould, core or other substrate, i.e. by depositing material and stripping-off the shaped article; Apparatus therefor (with compacting pressure [B29C 43/00](#) {; by lay-up of reinforcement of substantial or continuous length [B29C 70/30](#)})

Definition statement

This place covers:

depositing material and stripping-off the shaped article

Relationships with other classification places

Processes for applying liquids or other fluent materials are provided in [B05D 1/00](#) e.g. coating by rotation: [B05D 1/002](#); coating by spin coating [B05D 1/005](#); coating by dipping [B05D 1/18](#); coating performed by gravity only [B05D 1/30](#).

The difference with the processes provided in the group [B29C 41/00](#), is that in addition to coating step, a step of stripping of the article is provided (cf. the title of [B29C 41/00](#) "...i.e. by depositing material and stripping-off the shaped article...")

References

Limiting references

This place does not cover:

Shaping by spraying of fibres on a mould, former or core:	B29C 70/30

Gloves	A41D 19/00 , A47L 13/18 , A61B 42/10
Automotive skins	B60R 13/00

Synonyms and Keywords

In patent documents, the following words/expressions are often used as synonyms:

- spraying, slush moulding or casting, rotational moulding, rotomoulding, moulding by spinning, spin casting, centrifugal casting.

B29C 43/00

Compression moulding, i.e. applying external pressure to flow the moulding material; Apparatus therefor {(by liberation of internal stresses [B29C 61/006](#))}

Definition statement

This place covers:

Compression moulding refers to shaping polymeric materials by using moulding devices movable against the material to apply pressure for shaping and achieving a residual filling of a cavity;

Continuous compression moulding refers to making indefinite articles by using rotatable devices, e.g. wheels or rollers or calenders;

Devices to supply the material to the compression moulding device.

Relationships with other classification places

Related moulding processes are:

- Transfer moulding, i.e. transferring the required volume of moulding material by a plunger from a "shot" cavity into a mould cavity. Transfer moulding is classified in [B29C 45/02](#).
- Injection compression moulding, i.e. injecting the polymeric material under pressure into a mould followed by moving the mould or mould parts to compress the material to achieve filling of the cavity and the final shape of the article, wherein initially the mould can be open or closed and/or the cavity can be in a state with enlarged or reduced size. Injection compression moulding is classified in [B29C 45/561](#).
- Shaping by thermoforming (i.e. shaping sheets or sheet-like preforms after heating), e.g. shaping sheets by matched moulds or by deep-drawing and apparatus therefor. Thermoforming is classified in [B29C 51/00](#).
- Surface shaping of already moulded polymeric articles, e.g. by embossing and apparatus therefor. In the case of mechanical embossing, the surface shaping requires a reheating step for the surface to be embossed. Surface shaping of already moulded polymeric articles is classified in [B29C 59/00](#).
- Shaping composites, i.e. plastics material comprising reinforcements, fillers or preformed parts, e.g. inserts, are classified in [B29C 70/00](#). The use of moulding compounds comprising chopped or short fibres are classified in the moulding technique used, e.g. for compression moulding are classified in [B29C 43/003](#) or [B29C 43/006](#), for injection moulding using fibre reinforcements are classified in [B29C 45/0005](#) or for extrusion moulding using fibre reinforcements are classified in [B29C 48/2886](#).

B29C 43/58**Measuring, controlling or regulating {(for bank adjustment in calendaring [B29C 43/245](#))}****Definition statement***This place covers:*

- enabling a value, or its relation to a datum, to be determined in the sense of measuring as defined in Note 2 of class [G01](#);
- affecting a variable of the compression moulding process in any way, e.g. changing its direction or its value, maintaining its constant or limiting its range of variation;
- maintaining a variable at a desired value or within a desired range of values;
- selecting a specific value for a parameter, e.g. temperature or pressure, that has a substantial influence on the compression moulding process.

The mere selection of optimum or workable values or ranges of values, without accompanying disclosure of the influence on the compression moulding process or its objective does not qualify for classification in this group.

References**Limiting references***This place does not cover:*

Injection moulding methods

Injection moulding apparatuses

Articles obtained by injection moulding, as far as these articles are characterised by the injection moulding method

References

Limiting references

This place does not cover:

Reaction injection moulding, liquid injection moulding	B29C 67/246
--	-----------------------------

Special rules of classification

It is desired to identify the obtained articles and the applied materials by allocating the appropriate Indexing Codes as provided in the subclass [B29K](#) and [B29L](#).

Particular attention should be paid to the break down Indexing Codes, that are available only at additional informative level.

B29C 45/0001

{characterised by the choice of material}

Definition statement

This place covers:

Injection moulding processes characterised by the plastic material. The group contains documents concerning injection moulding with a special material or a process adapted for a certain material.

References

Limiting references

This place does not cover:

Injection moulding characterised by the use of fibres.	B29C 45/0005
Injection moulding characterised by the use of fillers	B29C 45/0013

B29C 45/0003

{of successively moulded portions rigidly joined to each other}

Definition statement

This place covers:

Injection moulding processes of continuous or endless articles.

EP847112, fig 7,

Fig. 7

EP826475 fig 1c.

FIG. 1c

Special rules of classification

Although this group covers a combination of several injection steps, the documents are not classified in [B29C 45/16](#)

B29C 45/0005

{using fibre reinforcements}

Definition statement

This place covers:

Injection moulding processes, whereby the fibres are dispersed in the plastic material. The dispersion is usually randomly.

Example EP893228

Fig. 1

---	------------------------------

B29C 45/02

Transfer moulding, i.e. transferring the required volume of moulding material by a plunger from a "shot" cavity into a mould cavity

Definition statement

This place covers:

Transfer moulding, whereby a shot cavity is provided within the mould. The material is transferred from the shot cavity into the mould cavity/cavities. The plunger is also part of the mould, the transfer takes place within a closed mould.

EP646948, fig 3.

Relationships with other classification places

The difference between transfer moulding and compression moulding, is that in case of the latter, the material is compressed while closing the mould and not by separate mould parts after closing.

A typical example of compression moulding

Identity cards and the like	B42D 25/00
Mounting details of chip cards in general	G06K 19/07745

B29C 45/14655

{connected to or mounted on a carrier, e.g. lead frame}

Definition statement

This place covers:

EP489349, fig 4, chip 22, lead frame 18. Runner 412 & Gate 416, 418. The moulding step in this group usually concerns transfer moulding.

FIG. 4

Relationships with other classification places

The scope of this group is small in comparison to a typical related product group like [H01L 21/565](#), since [B29C 45/14655](#) is limited to disclosures related to the moulding process as such.

References**Informative references**

Attention is drawn to the following places, which may be of interest for search:

Moulds for encapsulating semi-conductors	H01L 21/565
Apparatus for sealing, encapsulating for manufacturing or treating semiconductor or solid state devices	H01L 21/67126

B29C 45/1468**{Plants therefor}****Definition statement***This place covers:*

EP825006, fig 1. Loading, unloading, etc.

**References****Informative references***Attention is drawn to the following places, which may be of interest for search:*

Plants in general	B29C 45/0084
-------------------	------------------------------

B29C 45/14688**{Coating articles provided with a decoration}****Relationships with other classification places**

In [B29C 45/14688](#), the insert is the decoration itself or the insert comprises a decoration and nothing more.

In the case with a plurality of layers where the decoration layer is one of them, the classification is [B29C 45/14811](#)

Furthermore, typical for [B29C 45/14688](#) is that the moulding process is adapted or optimised for coating articles with a decoration.

Standard film overmoulding is classified [B29C 45/14778](#), even if the film is provided with a decoration.

WO98/09790, fig 2 & 5, insert 18 and plastic 28.

Fig.2

Fig.5

References

Limiting references

This place does not cover:

Incorporating decorated single layer or multi layered films by standard moulding processes	B29C 45/14778 , B29C 45/14811
Applying transfer foils	B29C 45/14827

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Decoration	A film provided with ink, paint or like means to create a decorative effect or information.
------------	---

B29C 45/14754

{being in movable or releasable engagement with the coating, e.g. bearing assemblies}

Definition statement

This place covers:

Overmoulding inserts that can move relatively to the plastic after finishing the moulding process. Typically applied for making bearings and to preventing adhesion.

EP27770, insert 37 and plastic 16.

FIG. 4

B29C 45/14778

{the article consisting of a material with particular properties, e.g. porous, brittle}

Definition statement

This place covers:

E.g. moulding on films

Special rules of classification

In this group, it is of utmost importance that the material, condition or the property of the insert is identified by allocating the appropriate Indexing Code as provided in the subclass [B29K](#)

B29C 45/14786

{Fibrous material or fibre containing material, e.g. fibre mats or fibre reinforced material}

Definition statement

This place covers:

Moulding processes whereby inserts are coated, but not impregnated

EP547625, insert 13 is not completely impregnated but coated at only one side

Fig. 3

JP5269785

Relationships with other classification places

The difference between [B29C 45/14786](#) and resin transfer moulding ([B29C 70/48](#)) is the way of coating.

In the group [B29C 45/14786](#), the fibrous insert is not completely impregnated but coated at only one side.

Relationships with other classification places

A process, whereby an insert of fibrous material is complete impregnated refers to resin transfer moulding, even if the process is done by injection moulding.

Coating of single fibres/wires is classified [B29C 45/14631](#)

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Coating reinforcement	B29C 45/14631
Resin transfer moulding	B29C 70/48

B29C 45/14795

{Porous or permeable material, e.g. foam}

Definition statement

This place covers:

EP743155 fig 8a-8d, directly injection on two layers of foam.

FIG. 8A

FIG. 8B

FIG. 8D

Relationships with other classification places

Note the difference between [B29C 45/14795](#) and [B29C 45/14811](#).

Moulding processes, whereby material is injected directly on foam, is covered by [B29C 45/14795](#).

In the case of a multilayer insert where one of the layers consist of foam, the classification is [B29C 45/14811](#)

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Coating multilayered articles	B29C 45/14811
-------------------------------	-------------------------------

B29C 45/14811**{Multilayered articles ([B29C 45/14827](#) takes precedence)}****Definition statement***This place covers:*

EP1025973, fig 1, release layer, protecting layer, etc.

Fig. 1

Injection fig 7 & 8.

Fig. 7

Fig. 8

**Relationships with other classification places**

Concerning the preference of [B29C 45/14827](#), it should be taken into account that this preference concerns either a double layered product where one layer is the transfer foil or a multilayered product, but were the invention concerns the use transfer foil as such (the identity of the other layers are not important for the invention).

Relationships with other classification places

Moulding processes, where the invention concerns the making of the multilayered inserts and where the fact that one of the layers can be removed is only disclosed on the level of additional information, is covered by the group [B29C 45/14811](#).

References

Limiting references

This place does not cover:

Insert and adhesive layer only	B29C 45/14311
Insert with only decoration, paint, ink	B29C 45/14688
Coating a porous layer	B29C 45/14795

B29C 45/572**{using movable mould wall or runner parts}****Definition statement***This place covers:*

the application of dwell pressure by means incorporated in the mould, e.g. locally pressurizing pins

EP662383 (mould wall part)

EP1052078 (runner part)

Relationships with other classification places

The difference between injection compression moulding ([B29C 45/561](#)) and [B29C 45/572](#) is typically that in injection compression moulding a movable mould half is used for shaping the material in the cavity, while in [B29C 45/572](#) the already shaped material is pressed for compensating the volume change caused by the shrinkage. Pressurizing is typically done locally e.g. by pressurizing pins

It is further noted, that [B29C 45/56](#) comprises a reference out, that [B29C 45/572](#) takes precedence.

B29C 45/58

Details

--	----------------------------

B29C 45/6721

{the separate element being displaceable with respect to the mould or the clamping cylinder}

Definition statement

This place covers:

MCFTM (mould clamping force transmission means, cf. [B29C 45/6714](#)) is 'removable'.

GB1220970 MCFTM 15 is put in between only when the mould is closed, see fig 1, otherwise opening & closing cylinder 6,7 would not be able to open the mould.

GB1032477 element 8 = removable MCFTM (fig 1 & 2)

FR2084078 removable MCFTM = element 44

B29C 45/6728

{the separate element consisting of coupling rods}

Definition statement

This place covers:

tie rods mounted on and movable with the movable mould plate and coupled to the fixed mould plate during mould clamping. Bayonet couplings are typically applied.

The separate mould clamping force transmission means, (SMCFTM) is the coupling rod 164 in EP296410, coupling means 180.

WO8902357, SMCFTM = coupling members 12,13. clamping by 16.

GB2064415 clamping bush 31, piston 18.

B29C 45/6764

{using hydraulically connectable chambers of the clamping cylinder during the mould opening and closing movement}

Definition statement

This place covers:

JP7186220, hydraulic chambers A1 & A2 are able to communicate through passage 19 and valve 21 during the opening and closing movement of the clamping die. Note the difference in active piston surface area on the left side and right side of 11

Clamping pressure is typically applied to only one of the chambers (A1), note the possibility of fluid leakage through 23 & 25.

EP281330, fig 1, cylinder 27 during closing volume hydraulic chamber decreases so hydraulic oil moves through 33 into W. Fig 2, valve 34 is closed and high pressure oil is fed from pump 14 to W.

FIG.1

FIG. 2

B29C 45/6771

{the connection being provided within the clamping cylinder}

Definition statement

This place covers:

EP342235, see fig 1,2 the different diameter clamping piston & cylinder. After closing, no connection between chamber 1a & 1b. In fig 1, the oil still flows between the chambers.

In fig 2, clamping is possible (chamber 1b).

EP281329, opening 47 can be closed by valve 52.

Fig 4, open.

Figure 6, closed valve, now high pressure in room B, possible to clamp. The connection is done through the plunger.

B29C 45/6778

{Stroke adjusting or limiting means}

Definition statement

This place covers:

DE2203020 cf. element 3

B29C 45/68

hydro-mechanical

Definition statement

This place covers:

WO9211993, closing by screw/nut (fig 1), hydraulic chamber 19 for clamping.

DE10103983

B29C 45/681

{using a toggle mechanism as mould clamping device}

Definition statement

This place covers:

EP192484, piston 4 drives the toggle 5 for opening, closing and clamping.

WO8900914, cf. fig 1

B29C 45/683

{using both a toggle mechanism as mould closing device and another mechanism as mould clamping device}

Definition statement

This place covers:

FR2317982, closing by toggle. The toggle is only used for closing, not for clamping. A separate cylinder (6,7,8) is provided for clamping.

FR2302187, Closing of toggle 5,6 by cylinder 1. Separate means (14) for clamping

B29C 45/72

Heating or cooling

Definition statement

This place covers:

Heating or cooling of the mould (covered by [B29C 45/73](#)), the moulded articles (covered by [B29C 45/7207](#)), the injection unit (covered by [B29C 45/74](#)) as well as the mould and the injection unit (covered by [B29C 45/72](#)).

Reaction extrusion	C08
Formation of filaments, threads, or the like, e.g. by melt spinning	D01D 5/00

Special rules of classification

All material aspects, not only the moulding material as such, but also fillers, preformed parts of mould (die) composition has to be identified by allocating the appropriate Indexing Code of [B29K](#). This also applies to moulding material properties, e.g. tear strength for identifying that extruded layers are easily torn apart is classified in [B29K 2995/0081](#).

Extrusion techniques characterised by the material must be allocated a classification in [B29C 48/0022](#).

All SHAPING CONDITIONS influencing the extrusion technique, e.g. extrusion in sterile or vacuum environments, the application of vibrations, must be identified by allocating the appropriate Indexing Code as provided in [B29C 2791/004](#) and subgroups, as well the classification in [B29C 48/14](#) or subgroups.

Cutting operations and printing operations must be identified by allocating the appropriate Indexing Code as provided in [B29C 2793/00](#) and [B29C 2795/00](#).

All ARTICLES must be identified by allocating the appropriate Indexing Codes as provided for by the subclass [B29L](#), e.g. anchoring between layers in general, e.g. due to chemical treatment [B29C 2045/1664](#), mechanical anchoring in general, e.g. layers gripping into each other [B29C 37/0082](#).

COMBINATIONS of extrusion and other techniques corresponding to the subgroups of [B29C 48/001](#) are classified in [B29C 48/001](#) or one of its subgroups.

Orienting or stretching of extruded materials should be identified by allocation the Indexing Code [B29K 2995/005](#) and [B29K 2995/0046](#) or one of its subgroups.

The Indexing Codes [B29C 2791/00](#) - [B29C 2791/003](#) are generally not used in this group [B29C 48/00](#).

All MEASURING and CONTROL aspects must receive the relevant code(s) in the [B29C 2948/92](#) indexing scheme.

Applying coating, colouring	B29D 11/00865 , B29D 11/00894
Pigments, colouring agents	B29K 2105/0032
Materials having optical properties	B29K 2995/0018
Coloured articles	B29K 2995/002
Multi-coloured articles	B29K 2995/0021

B29C 48/175

{comprising a multi-coloured single component, e.g. striated, marbled or wood-like patterned}

Definition statement

This place covers:

**B29C 48/18**

the components being layers

Definition statement

This place covers:

Co-extrusion of several components, e.g. layers

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Incorporating preformed components	B29C 48/15
Dies for co-extrusion of multi-component articles	B29C 48/304 , B29C 48/335
Flow dividers for layer multiplication	B29C 48/71
Plastic layered products	B29L 2009/00
Layered products	B32B 1/00 - B32B 33/00
Methods or apparatus for laminating	B32B 37/00

B29C 48/185

{comprising six or more components, i.e. each component being counted once for each time it is present, e.g. in a layer}

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Layer multiplication	B29C 48/71
----------------------	----------------------------

B29C 48/19

the layers being joined at their edges

Definition statement

This place covers:

B29C 48/20

one of the layers being a strip, e.g. a partially embedded strip

Definition statement

This place covers:

B29C 48/21

the layers being joined at their surfaces

Definition statement

This place covers:

**B29C 48/22**

with means connecting the layers, e.g. tie layers or undercuts

References**Informative references**

Attention is drawn to the following places, which may be of interest for search:

Mechanical anchoring in general, e.g. layers gripping to each other	B29C 37/0082
Anchoring between layers in general, e.g. due to chemical treatment	B29C 2045/1664
Tear strength in general, e.g. layers easily torn apart	B29K 2995/0081

B29C 48/23

with means for avoiding adhesion of the layers, e.g. for forming peelable layers

Use of materials as reinforcements	B29K 2201/00 - B29K 2313/00
Use of materials as fillers	B29K 2401/00 - B29K 2511/00

B29C 48/29

in liquid form

Definition statement

This place covers:

For example, feeding additives

References**Informative references**

Attention is drawn to the following places, which may be of interest for search:

Plasticisers	B29K 2105/0038
Liquid or viscous moulding materials	B29K 2105/0058

B29C 48/295

in gaseous form

Definition statement

This place covers:

For example, feeding of blowing agents

References**Informative references**

Attention is drawn to the following places, which may be of interest for search:

Moulding material in a gaseous state	B29K 2105/0055
Moulding material in plasma state	B29K 2105/0082

B29C 48/297

{at several locations, e.g. using several hoppers or using a separate additive feeding}

Definition statement

This place covers:

For example, using separate reinforcement feeding

B29C 48/3001

{characterised by the material or their manufacturing process}

Special rules of classification

Materials and coatings for calibrators are classified in the same groups as for dies, [B29C 48/3001](#), [B29C 48/3003](#)

B29C 48/302

{being adjustable, i.e. having adjustable exit sections}

References**Informative references**

Attention is drawn to the following places, which may be of interest for search:

Flow control means before the exit section	B29C 48/2556
--	------------------------------

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Exit section	last part of die shaping the material
--------------	---------------------------------------

B29C 48/303

{using dies or die parts movable in a closed circuit, e.g. mounted on movable endless support ([B29C 48/35](#) takes precedence)}

Definition statement

This place covers:

FIG. 1

References**Limiting references**

This place does not cover:

Extrusion nozzles or dies with rollers	B29C 48/35
--	----------------------------

Informative references

Attention is drawn to the following places, which may be of interest for search:

Continuously moving moulds in general	B29C 33/36
Casting between endless belts	B29C 39/16
Compression moulding between endless belts	B29C 43/228
Foaming between endless belts	B29C 44/30
Blow moulding of articles of indefinite length using moulds movable in closed circuit	B29C 49/0021
Blow moulding using moulds mounted on movable endless supports	B29C 49/38

B29C 48/304

{specially adapted for bringing together components, e.g. melts within the die}

References**Informative references**

Attention is drawn to the following places, which may be of interest for search:

Co-extrusion of multi-component articles	B29C 48/18
--	----------------------------

B29C 48/305

having a wide opening, e.g. for forming sheets

Definition statement

This place covers:

For example, extrusion dies for panels or plates

B29C 48/307

{specially adapted for bringing together components, e.g. melts within the die}

References**Informative references**

Attention is drawn to the following places, which may be of interest for search:

Co-extrusion of multi-component articles	B29C 48/18
--	----------------------------

B29C 48/31

{being} adjustable {, i.e. having adjustable exit sections}

References**Informative references**

Attention is drawn to the following places, which may be of interest for search:

Flow control means before the exit section	B29C 48/2556
--	------------------------------

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Exit section	last part of die shaping the material
--------------	---------------------------------------

B29C 48/325

{being} adjustable {, i.e. having adjustable exit sections}

References**Informative references**

Attention is drawn to the following places, which may be of interest for search:

Flow control means before the exit section	B29C 48/2556
--	------------------------------

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Exit section	last part of die shaping the material
--------------	---------------------------------------

B29C 48/335

Multiple annular extrusion nozzles in coaxial arrangement, e.g. for making multi-layered tubular articles

References**Informative references**

Attention is drawn to the following places, which may be of interest for search:

Co-extrusion of multi-component articles	B29C 48/18
--	----------------------------

B29C 48/34

Cross-head annular extrusion nozzles, i.e. for simultaneously receiving moulding material and the preform to be coated

Definition statement

This place covers:

Side feeding the nozzle, i.e. nozzle axis not on the extruder axis, but normally perpendicular to it or at an angle

B29C 48/345

Extrusion nozzles comprising two or more adjacently arranged ports, for simultaneously extruding multiple strands, e.g. for pelletising

Definition statement

This place covers:

Multiple separate nozzle outlets next to each other.

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Extrusion of particle, powder, granular shapes	B29C 48/04
Extrusion of filamentary shapes	B29C 48/05
Extrusion followed by under-water pelletizing	B29B 9/065
Producing filamentary material	B29D 99/0078
Electro spinning	D01D 5/00
Melt blowing	D04H 1/54

Special rules of classification

Pure melt-extrusion where the filaments are not shaped/formed by extrusion through the die but with other extrusion aspects should be allocated the Indexing Code [B29C 48/00](#), but not an inventive or additional classification in [B29C 48/345](#) for this aspect.

B29C 48/35

with rollers

Definition statement

This place covers:

Rollers shape the material exiting the extruder nozzle - normally nozzle exit at a roller or between rollers

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Calendering	B29C 43/24
-------------	----------------------------

B29C 48/36

Means for plasticising or homogenising the moulding material or forcing it through the nozzle or die

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Means for plasticising or homogenising in injection moulding	B29C 45/46
--	----------------------------

B29C 48/37

Gear pumps

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Gear pumps	F04C 2/08
------------	---------------------------

B29C 48/375

Plasticisers, homogenisers or feeders comprising two or more stages

Definition statement

This place covers:

For example, one plasticiser after the other

B29C 48/38

using two or more serially arranged screws in the same barrel

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Multi stage plasticising using separate plasticisers, e.g. screw extruder followed by a gear pump	B29C 48/375
Mixers with consecutive casings or screws	B29B 7/487

B29C 48/387**{using a screw extruder and a gear pump}****References****Informative references***Attention is drawn to the following places, which may be of interest for search:*

Injection moulding using screws and injection ram or piston	B29C 45/54
---	----------------------------

B29C 48/39**a first extruder feeding the melt into an intermediate location of a second extruder****Definition statement***This place covers:*

Feeding a plasticised melt into another plasticised melt, e.g. feeding one plasticised melt into the middle of an extruder plasticising another melt.

References**Informative references***Attention is drawn to the following places, which may be of interest for search:*

Feeding of the raw material to be extruded	B29C 48/285
--	-----------------------------

B29C 48/395**using screws surrounded by a cooperating barrel, e.g. single screw extruders****Definition statement***This place covers:*

Screws or worms that transport, melt, mix and pump the material out through the nozzle and where the interaction between barrel to screw or screw to screw is important.

References**Informative references***Attention is drawn to the following places, which may be of interest for search:*

Means for plasticising or homogenising using screws in injection moulding	B29C 45/47
Design, e.g. calculations, experiments or theory, e.g. for intermeshing screws, mechanical strength or flow	B29C 48/251 - B29C 48/2519
Flow control by valves	B29C 48/2552
Explicit throttling	B29C 48/268
Cleaning or purging	B29C 48/2715
Screws	B29C 48/505
Screw elements, i.e. element shapes affecting flow	B29C 48/51 - B29C 48/67

Barrels	B29C 48/68
Venting	B29C 48/766
Heating or cooling at plasticising zone	B29C 48/80
Handheld extruders	B05C 17/00
Mixers with screw or helix	B29B 7/42
Presses using screws or worms	B30B 11/24

B29C 48/40

using two or more parallel screws {or at least two parallel non-intermeshing screws}, e.g. twin screw extruders

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Mixers with two or more intermeshing devices	B29B 7/46
--	---------------------------

B29C 48/42

Non-identical or non-mirrored screws

Definition statement

This place covers:

For example, the screws having differing lengths or different screw element types

B29C 48/425

using three or more screws (serially arranged screws [B29C 48/38](#), [B29C 48/385](#))

Definition statement

This place covers:

For example, screws arranged next to each other in a circular configuration

References

Limiting references

This place does not cover:

Plasticizers, homogenisers or feeders using two or more serially arranged screws	B29C 48/38 , B29C 48/385

B29C 49/00

Blow-moulding, i.e. blowing a preform or parison to a desired shape within a mould; Apparatus therefor

Definition statement

This place covers:

Blow-moulding methods, blow-moulding apparatus and articles obtained by blow-moulding, when these articles are characterised by the blow-moulding method.

Simulation of blow-moulding or any other simulated aspect related to blow-moulding, e.g. simulating heating a preform before blow-moulding. This aspect is covered in the group [B29C 49/42398](#).

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Injection a fluid, e.g. air, in molten plastic in injection moulding	B29C 45/1704
Extrusion moulding of tubular films	B29C 48/10
Vacuum or pressure forming of sheet like materials	B29C 51/10
Enlarging tube ends using pressure difference	B29C 57/08
Making of balloon catheters	A61M 25/1027
Metal blow-moulding	B21D 26/00
Making preforms per se	B29B 11/00
Packaging individual articles in containers or receptacles whereby the machines incorporate means for making the containers	B65B 3/022
Labelling of blow-moulded articles outside the mould	B65C 3/00
Glass blow-moulding	C03B 9/00

Special rules of classification

For articles and materials, as much as possible additional classification by adding the Indexing Codes of [B29K](#) and [B29L](#) is recommended.

If more than 4 different thermoplastic materials are described in the disclosure, then the Indexing Code [B29K 2101/12](#) should be allocated. In addition, only up to 4 of the disclosed uncommon thermoplastic materials are classified (common thermoplastics for blow-moulding are PET, PE, PP) by allocating the appropriate Indexing Code as provided in [B29K 2001/00](#) - [B29K 2101/00](#).

Inventive and additional information disclosed in documents to be classified should be identified by allocation the appropriate classification codes of [B29C 49/00](#) - [B29C 49/78](#). In particular attention should be paid to the so called break down Indexing Codes, which are only present at additional information level, but should be allocated if applicable.

If during blow-moulding also vacuum is used, or only vacuum is used for deformation of the tubular parison then one or both of the following classification codes are additionally allocated: [B29C 2791/006](#) and/or [B29C 2791/007](#).

The indexing of preforms for blow-moulding bottles using the coding scheme under [B29C 2949/07](#) is obligatory when the structure of the preform differs from the conventional shape (one layer, open neck, flange, cylindrical body, closed semi-spherical end).

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Preform or parison	A tubular object obtained by moulding substantially consisting of plastic material, which has to undergo an additional processing step, e.g. blow-moulding, to obtain its final shape, examples are: tubes, extruded parisons, two parallel sheets which behave like tubular preforms, injection moulded tubular preforms normally with one end closed.
Blowing	using a pressurized blowing gas to deform the tubular preform or parison; but also applying a vacuum on one side of the tubular article, since the ambient pressure is deforming the tubular preform or parison.

B29C 49/0005

{characterised by the material}

Definition statement

This place covers:

- Blow moulding processes, whereby their disclosure focuses on the materials or material parameters

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Compositions of macromolecular compounds in general	C08L 1/00 - C08L 101/10
---	---

Special rules of classification

If reinforcing material is comprised in the material to be thermoformed, then the following Indexing Codes should additionally be allocated: the appropriate subgroups of [B29K 2105/06](#) and [B29K 2201/00](#) - [B29K 2313/00](#).

B29C 49/0006**{for heating or cooling}****Definition statement***This place covers:*

Modification or selection of the moulding material to facilitate heating or cooling.

B29C 49/0015**{Making articles of indefinite length, e.g. corrugated tubes}****Definition statement***This place covers:*

- WO02/36333

**B29C 49/0021****{using moulds or mould parts movable in a closed path, e.g. mounted on movable endless supports}****Definition statement***This place covers:*

- Blow moulding processes whereby either only pressure, pressure and vacuum or only vacuum is used during the forming process of indefinite length articles, as long as the preform is three dimensionally deformed.

- WO2004110734

Special rules of classification

It is highly desirable that all documents classified in [B29C 49/0021](#) the appropriate Indexing Code in [B29L 2023/00](#) is added to identify the type of tubular product

B29C 49/0022

{characterised by mould return means}

Definition statement

This place covers:

Details of the device to return the moulding section to a receiving portion of the parison.

B29C 49/0023

{using adjustable machine tables, e.g. to align extrusion nozzles with the moulds}

Definition statement

This place covers:

Relative movement of the mould table or support of the extrusion nozzle for alignment of the apparatus.

B29C 49/0024**{using varying mould speed}****Definition statement***This place covers:*

Modification of the mould speed to account for changes in mould geometry or extrudate thickness. Usually to form a product having uniform thickness.

B29C 49/0025**{subsequent mould cavities being different, e.g. for making bells}****Definition statement***This place covers:*

Indefinite length moulding apparatus which has cavities of different configurations along the mould path.

Illustrative example of subject matter classified in this group:

B29C 49/0027

{involving the change of moulds, e.g. in production processes without interrupting the production processes}

Definition statement

This place covers:

Using an auxiliary device, e.g. conveyor, to change the moulds without pausing the moulding apparatus.

B29C 49/0028

{using variable forming length, e.g. adapted to cooling needs}

Definition statement

This place covers:

Indefinite length moulding apparatus whose length can be varied according to desired process conditions or outcomes (e.g. cooling).

Illustrative example of subject matter classified in this group:

B29C 49/0029

{wherein the process is characterised by the pressure used, e.g. using varying pressure depending on sequence of cavity shapes}

Definition statement

This place covers:

Indefinite length moulding apparatus which uses varying/controlled pressure in the moulding process.

B29C 49/003

{wherein the process is characterised by temperature conditioning, e.g. using inside cooling by air}

Definition statement

This place covers:

Indefinite length moulding apparatus which involves various temperature conditioning techniques (e.g. interior cooling air). Examples include cooling of fused layers and details of the internal cooling plug.

B29C 49/0031**{Making articles having hollow walls}****Definition statement***This place covers:*

B29C 49/006

{Blow-moulding plants, e.g. using several blow-moulding apparatuses cooperating}

Definition statement

This place covers:

A combination of different apparatus to form a single blow-moulding plant. More than just extrusion or injection moulding combined with blow-moulding, could also be more than one blow-mould or other moulding apparatus.

B29C 49/0062

{using two or more parallel stations, e.g. two parallel heating or blowing stations}

Definition statement

This place covers:

A plant wherein the plurality of stations are parallel to one another.

B29C 49/0064

{the number of preform manufacturing stations being different to the number of blowing stations}

Definition statement

This place covers:

Blow-moulding plants that have preform manufacturing segments and blow-moulding segments which are not equal in number.

In the example below the injection mould has 32 cavities and the blow-mould has 4 cavities.

**B29C 49/0208**

{joining several separate preforms while blow-moulding, e.g. two cylindrical preforms welded together during blowing}

Definition statement

This place covers:

Manufacturing process which includes both preform manufacture and blow-moulding of the preform, especially including manufacturing more than one distinct preforms and joining them together during blow-moulding.

Illustrative example of subject matter classified in this group:

B29C 49/04

Extrusion blow-moulding

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Making preforms by extrusion moulding	B29B 11/10
---------------------------------------	----------------------------

Special rules of classification

- If the parison shape, e.g. the cross section or thickness distribution, is different from the standard cylindrical shape, then the to be classified document should receive a class in [B29C 49/071](#) as inventive information and only [B29C 49/04](#) as additional information.

- If the parison is multilayered, then the to be classified document should receive a class in [B29C 49/22](#) as inventive information and only [B29C 49/04](#) as additional information.

B29C 49/04102

{extruding the material continuously}

Definition statement

This place covers:

Manufacturing preforms via continuous extrusion prior to blow-moulding the preforms.

Illustrative example of subject matter classified in this group:

B29C 49/04104

{extruding the material discontinuously}

Definition statement

This place covers:

Manufacturing preforms via extrusion which is not continuous, prior to blow-moulding the preforms.

B29C 49/08**Biaxial stretching during blow-moulding****Glossary of terms**

In this place, the following terms or expressions are used with the meaning indicated:

Biaxial stretching	stretching in two directions whereby one stretching component must be in longitudinal direction of the preform or in extrusion direction of an extruded parison
--------------------	---

B29C 49/085

{without pre-stretching, e.g. simple blowing step}

Definition statement

This place covers:

Blow moulding processes, whereby the preform length before blow moulding is shorter than the mould cavity. The preform has therefore also a stretching component in the longitudinal direction during the blowing operation.

B29C 49/086

{mono-axial stretching, e.g. either length or width}

Definition statement

This place covers:

Blow-moulding process where a preform of a particular configuration is stretched only one direction.

Illustrative example of subject matter classified in this group:

Fig. 4

B29C 49/18

using several blowing steps ([B29C 49/16](#) takes precedence)

Definition statement

This place covers:

Blow-moulding using several blowing steps, whereby between each blowing step for a period of time, depressurisation is being applied, thereby causing a period with atmospheric pressure inside the preform/container.

Illustrative example of subject matter classified in this group:

**References****Limiting references**

This place does not cover:

Multiple blow moulding steps, whereby one step is used to expand the preform in longitudinal direction	B29C 49/16
--	----------------------------

Informative references

Attention is drawn to the following places, which may be of interest for search:

Multiple blow-moulding steps followed by additional heat shrinking	B29C 49/6472
--	------------------------------

Special rules of classification

Multiple blow-moulding steps, with longitudinal stretching during each blowing step are additionally classified in [B29C 49/08](#) or one of its subgroups.

As example the following disclosure should be classified [B29C 49/12](#) and [B29C 49/18](#).

B29C 49/1802

{the first mould cavity being bigger than a second mould cavity}

Definition statement

This place covers:

A blow-moulding method which is characterised by at least two mould cavities: the first cavity is larger than the second, often times to allow for a shrinkage/temperature conditioning step between the two cavities.

Illustrative example of subject matter classified in this group:

B29C 49/20

of articles having inserts or reinforcements {; Handling of inserts or reinforcements}

Definition statement

This place covers:

- Auxiliary operations or auxiliary means relating to inserts or reinforcements, e.g. handling or transferring of inserts

Special rules of classification

Details of the location of the insert (on the inside or outside of the final article), handling of the inserts (e.g. feeding into the mould) or treatment of the inserts (e.g. preheating) are identified by the allocation of break down Indexing Codes, which are only present at additional information level.

When details of inserts or reinforcements are indicated, then it is highly desirable to allocate additionally the following classification codes for additional information:

- [B29K 2601/00](#) - [B29K 2713/02](#)

- [B29K 2201/00](#)- [B29K 2313/02](#)

B29C 2049/2071

{comprising electronic elements or detection means, e.g. chips, RFIDs or barcodes}

Definition statement

This place covers:

Blow-moulding articles comprising inserts of an electronic nature.

Illustrative example of subject matter classified in this group:

B29C 49/22

using multilayered preforms or parisons

Definition statement

This place covers:

Multilayered parisons produced by extrusion moulding.

Parisons having loose layers before blow-moulding.

Illustrative example of subject matter classified in this group:

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Tubular layered products per se	B32B 1/08
Multilayered plastic containers, e.g. bottles	B65D 1/0215

Special rules of classification

If applicable, it is highly desirable to allocate classification in [B29C 2949/07](#) and subgroups, in particular [B29C 2949/30](#), for information related to the geometrical distribution or dimensions of the layers.

B29C 49/24

Lining or labelling

Definition statement

This place covers:

Lining

Illustrative example of subject matter classified in this group:

Labelling

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Lining or sheeting in general	B29C 63/00
Producing labels	B31D 1/02
Labelling other than flat surfaces in general	B65C 3/00
In mould labelled containers	B65D 23/0864
Labels in general e.g. for thermo adhesion	G09F 3/04

Special rules of classification

If the label itself is specific then the Indexing Code [B29L 2031/744](#) should be allocated

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Lining	Covering the whole outer and/or inner surface of articles with a heated preform or parison. The heated preform or parison is stretched and three dimensionally deformed.
Labelling	Connecting a label which is inside of a mould to a heated preform or parison while the preform or parison is blow moulded. Often also called "in mould labelling"

B29C 49/2408

{In-mould lining or labelling}

B29C 2049/2442

{while blow-moulding, e.g. the preform expansion deforms the label or lining}

Definition statement

This place covers:

Blow-moulding process/apparatus which uses multi-layered preforms or parisons as the elements to which air is applied to cause shaping.

B29C 49/249

{explicit labelling}

Definition statement

This place covers:

Labelling process which includes a method for moulding a plastic container within a mould including an RFID tag to generate a container which leaves a mould having an RFID tag bonded between the

container and a label. This method provides for an integrally, extrusion blow-moulded container, label and RFID tag combination.

B29C 49/251

{explicit lining ([B29C 49/26](#) takes precedence)}

Definition statement

This place covers:

Illustrative example of subject matter classified in this group:

B29C 49/28**Blow-moulding apparatus****Special rules of classification**

- If the alleged inventive information of the document to be classified is already classified somewhere else then the classification as provided for in [B29C 49/28](#) - [B29C 49/40](#) should be allocated as additional information only.

B29C 49/28002

{designed for reduced size or for experiments, e.g. lower inertia, transportable or experimental apparatus}

Definition statement

This place covers:

Blow-moulding machines which are smaller in scale than other machines to accommodate experimental environments or situations where transportability is ideal.

Illustrative example of subject matter classified in this group:

B29C 49/28004**{designed for easy access by operator}****Definition statement***This place covers:*

A blow-moulding machine which is designed to be easily accessed/operated by an operator.

B29C 49/28006**{having special frame}****Definition statement***This place covers:*

A blow-moulding machine which is characterised by a particular frame configuration.

Illustrative example of subject matter classified in this group:

FIG. 1

B29C 49/28008

{mounting, exchanging or centering machine parts, e.g. modular parts}

Definition statement

This place covers:

A blow-moulding machine which includes interchangeable/modular parts, allowing for ease of mounting, exchanging or repositioning.

Illustrative example of subject matter classified in this group:

FIG. 17 shows a presentation as an illustration of the process of changing a handling part. Here, the change arm 54 is essentially moved upwards vertically (cf. double arrow Y) by the respective joints, in order to exchange the handling parts, here heating mandrels 96 and shielding plates 98. It is possible

to, at first, remove the existing handling parts 96 and 98, then turn the changing element 53 by 180° in order to arrange immediately the new handling parts on the heating device 50.

B29C 49/28012

{using several moulds whereby at least one mould is different in at least one feature, e.g. size or shape ([B29C 49/0025](#) takes precedence)}

Definition statement

This place covers:

A blow-moulding machine which includes several moulds having different features than each other, e.g. size, shape.

Opening, closing or clamping of moulds in general	B29C 33/20 - B29C 33/28
---	---

B29C 49/5602**{using cams}****Definition statement***This place covers:*

Opening or closing the mould with the use of cams.

B29C 49/5603**{using toggle mechanism}****Definition statement***This place covers:*

Opening or closing the mould with the use of a toggle mechanism.

B29C 49/5604**{using spindle nut mechanism}****Definition statement***This place covers:*

Opening or closing the mould with the use of a spindle nut mechanism.

B29C 49/5605**{Hydraulically operated, i.e. closing or opening of the mould parts is done by hydraulic means}****Definition statement***This place covers:*

Opening or closing the mould hydraulically.

B29C 49/5606**{Pneumatically operated, i.e. closing or opening of the mould parts is done by hydraulic means}****Definition statement***This place covers:*

Opening or closing the mould pneumatically.

B29C 49/5607**{Electrically operated, e.g. the closing or opening is done with an electrical motor direct drive}****Definition statement***This place covers:*

Opening or closing the mould electrically.

B29C 49/5608

{Asymmetric movement of mould parts, e.g. by moving only one mould part}

Definition statement

This place covers:

Opening or closing the mould by asymmetric movement of the mould parts.

Illustrative example of subject matter classified in this group:

**B29C 49/561**

{Characterised by speed, e.g. variable opening closing speed}

Definition statement

This place covers:

Opening or closing of the mould is characterised by the opening or closing speed.

B29C 49/5611

{Tilting movement, e.g. changing angle of the mould parts towards the vertical direction}

Definition statement

This place covers:

Opening or closing the mould by tilting movement of a mould part.

B29C 49/5612**{characterised by bottom part movement}****Definition statement***This place covers:*

Opening or closing the mould by movement of a bottom portion of the mould.

B29C 49/5613**{characterised by connected mould part movement, e.g. bottom part movement is linked to mould half movement}****Definition statement***This place covers:*

Opening or closing the mould by movement of a connected mould part.

Illustrative example of subject matter classified in this group:

FIG. 6

B29C 49/5614**{Safety means, e.g. during ejection or locking failure}****Definition statement***This place covers:*

Safety devices for use during opening or closing of the mould.

B29C 2049/5631**{Hydraulic}****Definition statement***This place covers:*

Hydraulically operated clamping means.

B29C 2049/5633**{Pneumatic}****Definition statement***This place covers:*

Pneumatically operated clamping means.

B29C 2049/5634**{Electric, e.g. electric motor}****Definition statement***This place covers:*

Electrically operated clamping means.

Illustrative example of subject matter classified in this group:

**FIG. 2**

The machine wherein the coupling means (36) is constructed as a rack, threaded rod (40), link chain, toothed belt, V-belt or corresponding means, and the rotating engagement member is constructed as a toothed wheel, threaded wheel (42) or corresponding turning means, and the motor (38) is constructed as an electrically driven motor (44).

B29C 2049/5635**{Avoiding mould deformation}****Definition statement***This place covers:*

Mould apparatus clamping elements which function in a manner that avoids or prevents deforming the mould.

Illustrative example of subject matter classified in this group:

As seen in Figure 1, Element 30 is a cushion which can be inflated such that it projects slightly past the rear face of the mould-half, at least on three sides. Thus, by inflating the cushion 30 with a fluid at a pressure substantially equal to or greater than that of the blow-moulding fluid, the resulting action of these two fluids on the mould-half is an action that pushes toward the other mould-half 14.

In the extrusion-blow-moulding process, pressures on the order of 10 bars are generally used. Also, when the mould has a large cavity or several cavities, the forces exerted by the fluid pressures can be quite large. However, the use of a flexible cushion makes it possible to ensure that the compensating pressure is distributed uniformly over the entire rear face of the mould-half. In this way, the force of the first mould-half 12 applied against the second 14 is uniformly distributed over the entire joint plane of the mould, without the need to use particularly rigid mould-halves or mould clamping units, which allows costs to be decreased.

B29C 2049/5636**{using closing means as clamping means}****Definition statement***This place covers:*

A mould closing feature which also functions as the mould clamping feature.

Illustrative example of subject matter classified in this group:

To close the blow-mould and to hold it closed with a high force for a blow-moulding process, the electric motor is activated to drive the push mechanism. The push mechanism, preferably designed as a spindle drive, moves the push rod out of the push mechanism and the electric motor reaches

the required torque. Directly after the blow-mould has been closed with high force by an elastic deformation, the braking device is activated to hold the push rod in a state of constantly maintained tension in its instantaneous position and to hold the blowing mould closed with a required closing force.

Fig. 3A

B29C 2049/5661

{Mechanical}

Definition statement

This place covers:

A mould locking element which is operated mechanically.

Illustrative example of subject matter classified in this group:

The cross-section of the coupling member 80b which is to be introduced into and co-operate with the receiving coupling member 80a is so adapted to the cross-sectional shape of the opening in the receiving coupling member 80a so that, when the receiving coupling member 80a is in the appropriate angular position, the coupling member 80b can be introduced into the coupling member 80a through

the opening therein, in the course of the mould-closing movement. Thereafter, the receiving coupling member 80a is rotated about its longitudinal axis or about the longitudinal axis of the locking portion, thus providing a positively locking connection between the two coupling members. That position is shown in FIG. 5.

B29C 2049/5662

{Latch}

Definition statement

This place covers:

A mould locking element which includes a mechanically-operated latch feature.

Illustrative example of subject matter classified in this group:

B29C 2049/5663

{Rotating locking pin}

Definition statement

This place covers:

A mould locking element which is a mechanically-operated rotating pin.

Illustrative example of subject matter classified in this group:

Locking mechanism 25 is actuated by piston and cylinder unit as soon as mould platens 10, 11 are butted to each other and hollow mould 14 is closed. Since locking bush 27 is firmly screwed to mould platen 10 and locking rod 28 is rotatable in mould platen 11 but axially fixed relative thereto, with platens 10, 11 abutting, lock head 29 penetrates into opening 31 of locking bush 27, the mechanism being adjusted so as to always insure an alignment of lock head 29 with opening 31.

B29C 2049/5664

{Translating locking pin}

Definition statement

This place covers:

A mould locking element which is a mechanically-operated translating pin.

Illustrative example of subject matter classified in this group:

fig. 2

See reference sign 8

Figure 4

See reference sign 21

B29C 2049/5665

{Magnetic}

Definition statement

This place covers:

A mould locking element which is magnetically operated.

Illustrative example of subject matter classified in this group:

This figure shows a corresponding closed state of the blow-moulding station, i.e. a state in which the first locking element 82 engages in the second locking element 84. The reference number 95 designates a holding magnet which cooperates with a magnetizable element 91, which is likewise arranged in a fixed manner on the locking element 82, and in this way holds the first locking element in the locking position with a pre-set magnetic force. This holding magnet 95 thus constitutes the second magnetic element.

B29C 2049/5666

{Pneumatic}

Definition statement

This place covers:

A mould locking element which is pneumatically operated.

Illustrative example of subject matter classified in this group:

The locking and unlocking of the mould halves when the mould is in its closed state is effected utilising a locking arrangement which will be described. The locking arrangement comprises a pneumatic piston and cylinder arrangement 40. The piston rod 41 of the arrangement 40, when moved upwardly, engages with the underside of the lowermost locking section 42a of a series of end-abutting locking members 42 which are in the form of locking bars. The mould halves 1 and 2 are provided with clamps 3.

B29C 49/58

Blowing means

Definition statement

This place covers:

Illustrative example of subject matter classified in this group:

Synonyms and Keywords

In patent documents, the following words/expressions are often used as synonyms:

- "blowing means", "blow pin", "blowing nozzle" and "blowing mandrel"

B29C 2049/5898

{Regulation of the blowing means clamp force}

Definition statement

This place covers:

Control of the force of the attachment, or clamp applied, between the blowing element and the preform/parison.

Illustrative example of subject matter classified in this group:

After the seal 30 has contacted the upper lip of the parison 24 and the piston 38 moved upward against the biasing force of spring 80, a gaseous blowing medium, typically air, is quickly injected through outlet 14 and into axial passageway 46. The downwardly angled ports 51 extending from the axial passageway 46 through the inner wall 53 of chamber 34 causes a quick increase in pressure within the chamber 34. This increase in pressure within chamber 34 exerts a force on the annular pressure surface 72 of piston 38 causing it to press downwardly to ensure a complete and full seal by the sealing means 30 on the upper lip of opening 22.

B29C 49/60**Blow-needles****Definition statement**

This place covers:

Illustrative example of subject matter classified in this group:

Support 30 facilitates the piercing of the parison

Retractable blow needle, the blow needle has special blow openings

Blow needle has special means to facilitate the piercing

B29C 2049/6091

{Avoiding needle marks, e.g. insertion in sprue}

Definition statement

This place covers:

Blow needle placement such that any needle marks are avoided. This could include needle insertion in a sprue or other area apart from the article.

Illustrative example of subject matter classified in this group:

B29C 2049/6092**{Blow needle sterilization}****Definition statement**

This place covers:

Processes or apparatus which include sterilizing the blowing needle.

Illustrative example of subject matter classified in this group:

An apparatus including an element for passing steam through said needle in the sterilization position before the sterile gas is passed through the needle. In operation, the needle 1 is retracted into chamber 2 and is initially connected to the steam system 8 in the position shown in FIG. 1 so as to sterilize the entire blowing circuit.

B29C 49/62

Venting means

Definition statement

This place covers:

Illustrative example of subject matter classified in this group:

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Venting means for moulds in general:	B29C 33/10
--------------------------------------	----------------------------

B29C 2049/6271

{for venting blowing medium, e.g. using damper or silencer}

Definition statement

This place covers:

Mould venting element which vents the blowing means, possibly including use of a damper or silencer.

Illustrative example of subject matter classified in this group:

Fig. 3f

As illustrated in FIG. 3f, during and after the step for cooling the mould 18, the cooling fluid—when it is formed by the compressed air escapes through said opening 46 to be evacuated through an exhaust device (not shown) that the blow-moulding means 20 comprise and that commonly comprises a sound suppressor. Noise linked to the expansion of compressed air and then to its evacuation is thus limited.

Advantageously, the evacuation of the cooling air from the mould 18 through such a sound suppressor makes it possible to control the pressure inside the moulding cavity 16, which makes it possible to raise the blow-moulding means 20 to the upper position and then to open again the moulding unit 12.

B29C 2049/6272

{using vacuum means}

Definition statement

This place covers:

Mould venting element which vents the blowing means using vacuum pressure.

Illustrative example of subject matter classified in this group:

After blowing the receptacle, the supply of high pressure sterile air is interrupted by switching distributor 30. The pressurized sterile blowing air in the receptacle is then evacuated through distributor 24 and valve 31. After evacuation distributor 24 is closed, the needle is withdrawn from the mould cavity by jack 16, distributor 30 is reversed and distributor 36 is opened. The coupling of the vacuum source 35 ensures complete evacuation.

B29C 49/6454

{through the preform thickness}

Definition statement

This place covers:

Illustrative example of subject matter classified in this group:

Heating apparatus or method that creates a desired temperature profile through a preform.

B29C 49/6458

{tangentially, i.e. along circumference}

Definition statement

This place covers:

Heating system/process for preforms such that there is a difference in temperature through the circumference of the preform, e.g. one radial location of the preform would be heated to a temperature that would differ from a temperature of second radial location.

Illustrative example of subject matter classified in this group:

B29C 49/6462

{by masking}

Definition statement

This place covers:

Heating including providing a heat shield of some sort which protects desired sections of the preform during heating, e.g. a handle or neck.

Illustrative example of subject matter classified in this group:

B29C 49/6463

{by contact heating or cooling, e.g. mandrels or cores specially adapted for heating or cooling preforms}

Definition statement

This place covers:

Illustrative example of subject matter classified in this group:

B29C 49/6464**{Heating}****Definition statement***This place covers:*

Heating a preform including using an element which is adapted to engage in contact with a surface of the preform to transfer heat thereto.

**B29C 49/6465****{Cooling}****Definition statement***This place covers:*

Cooling preforms including maintaining contact of a surface of the preform with interior corresponding surface of a cooling sleeve.

Illustrative example of subject matter classified in this group:

B29C 49/6466

{on the inside}

Definition statement

This place covers:

Temperature conditioning of preforms via contact on the preform interior with a heating or cooling mandrel.

Illustrative example of subject matter classified in this group:

B29C 49/6467

{on the outside}

Definition statement

This place covers:

Temperature conditioning of preforms via contact on the preform exterior with a corresponding heating or cooling element.

B29C 49/6472

{in several stages}

Definition statement

This place covers:

- Discontinuous heating having at least one additional phase where the preform is not heated, or even shortly cooled before the next heating phases starts

- DE3908219

B29C 49/648

{of preforms or parisons}

Definition statement

This place covers:

Temperature control/adjustment of preforms in parisons which occurs throughout more than one stage or process.

FIG. 2

EP 1 314 535 A1

B29C 49/6605**{Heating the article, e.g. for hot fill}****Definition statement***This place covers:*

Heating the article after a moulding step, e.g. in preparation for hot fill or post-processing steps.

B29C 49/66055**{using special pressurizing during the heating, e.g. in order to control the shrinking}****Definition statement***This place covers:*

Heating a blow-moulded article including controlling the pressure during heating, which could function to avoid shrinkage or to induce particular article features.

B29C 2049/6606**{Cooling the article}****Definition statement***This place covers:*

Cooling a blow-moulded article, e.g. using a water bath or spray, cooled air, refrigerated cabinet.

B29C 2049/671**{Conditioning the blown article outside the mould, e.g. while transporting it out of the mould}****Definition statement***This place covers:*

Thermally conditioning a blow-moulded article including affecting its temperature outside of the mould during transport or further processing.

B29C 49/68**Ovens specially adapted for heating preforms or parisons****Definition statement***This place covers:*

the heating device (oven) functioning as a whole

Special rules of classificationDetails of ovens specially adapted for heating preforms or parisons are classified in [B29C 49/64](#)

B29C 49/681

{using a conditioning receptacle, e.g. a cavity, e.g. having heated or cooled regions}

Definition statement

This place covers:

An oven which includes a cavity designed to receive and heat a preform/parison. Such a cavity could also have locations which are designed to cool or not heat specific locations of the preform/parison.

Illustrative example of subject matter classified in this group:

**B29C 49/682**

{characterised by the path, e.g. sinusoidal path}

Definition statement

This place covers:

An oven designed to thermally condition preforms/parisons which includes a distinctive conveyance path for such thermal conditioning, e.g. sinusoidal.

Illustrative example of subject matter classified in this group:

B29C 49/6825**{Mounting exchanging or centering ovens or parts thereof}****Definition statement***This place covers:*

An oven designed to thermally condition preforms/parisons which includes elements which are exchangeable, and the process of mounting, exchanging, or centering the oven parts.

Illustrative example of subject matter classified in this group:

Heating modules which are exchangeable or interchangeable (elements 11-16 in Figure).

B29C 49/683**{Adjustable or modular conditioning means, e.g. position and number of heating elements}****Definition statement***This place covers:*

An oven designed to thermally condition preforms/parisons which includes elements which are adjustable in quantity, position, or other ways.

B29C 49/6835**{using reflectors}****Definition statement***This place covers:*

An oven designed to thermally condition preforms/parisons which includes elements which are reflective.

Illustrative example of subject matter classified in this group:

A device that comprises reflectors (60) arranged in an external position relative to the heating tubes (40) and to the preforms (14) and so shaped as to reflect the heating radiation emitted by the heating tubes (40) disposed nearest the reflectors (60) in the direction of the preforms (14) of the farthest row of preforms through the free space between two successive preforms of the nearest row.

B29C 49/684**{using masking}****Definition statement***This place covers:*

Heating in an oven which includes masking elements that shield desired parts of a preform therein.

Illustrative example of subject matter classified in this group:

Fig. 3

B29C 49/6845

{using ventilation, e.g. a fan}

Definition statement

This place covers:

Heating in an oven which includes ventilation elements.

Illustrative example of subject matter classified in this group:

Fig. 2

Oven (10) for the heat treatment of thermoplastic preforms (12) each respectively comprising a first part (14, 16) in its definitive shape and a second part (18, 20) intended to be heated by heating means (30) arranged along at least part of a determined heating path followed by the preforms (12) travelling through the oven, the said oven (10) comprising a cooling system (36) capable respectively of cooling the first parts (14, 16) and the second parts (18, 20) of the preforms. The cooling system (36) comprises at least one cooling device (42) capable of air-cooling at least the second part (18, 20) of the preforms (12), the said cooling device (42) comprising at least ventilation means (52) capable of delivering a given flow rate of cooling air and means (58, 64) for selectively varying, along the heating

path of the preforms (12), at least the cooling airflow rate delivered by the said ventilation means (52) for cooling the said second parts (18,20) of the preforms (12).

Fig. 3

A bottle blank heating air channel for a bottle blowing machine, wherein a heating box is provided, wherein the heating box is set on the opposite side of the bottle body air channel air outlet, wherein a space for the bottle plank is formed between the heating box and opposite side of the bottle body air channel air outlet, wherein a ventilating channel is provided on the heating box, and wherein the air outlet of the ventilating channel is connected to the air inlet of the bottle body air outlet channel.

B29C 49/685

{Rotating the preform in relation to heating means}

Definition statement

This place covers:

Heating in an oven which includes preform rotation relative to the heating elements.

Illustrative example of subject matter classified in this group:

FIG. 4

Furnace for conditioning preforms, in particular for stretch blow-moulding plastic containers, comprising a plurality of heating chambers rotating in a circle for heating one preform each with infrared radiation, holding devices for holding the preforms during heating such that a section of the preform to be conditioned is arranged in a heating chamber, and a section of the preform not to be conditioned is arranged outside the heating chamber.

FIG. 3

An oven for blowing or stretch-blowing preforms to provide containers with oval section, comprising a path for the preforms, a transfer system of the preforms from an upstream transport system upstream of the oven and a transfer system of the heated preforms from the oven to a downstream transport system, wherein a plurality of mandrels are slidingly carried along the path, the mandrels configured to temporarily engage with the preforms to conduct the preforms along the path, the oven comprising at least one first heating module and at least one second heating module, wherein the oven comprises

a rotator for rotating said preforms by 180°, said rotator being in median position of said at least one second heating module.

B29C 49/6855

{Cooling of heating means, e.g. avoiding overheating}

Definition statement

This place covers:

Heating in an oven which includes the features of cooling the heating elements so as to prevent overheating of the apparatus or element to be heated.

Illustrative example of subject matter classified in this group:

FIG. 5A

The unit 1 includes a plurality of heaters 13, and a cooling circuit 18 inside a frame 7. The cooling circuit 18 limits the amount of heat produced by the heaters 13.

B29C 49/70

Removing or ejecting blown articles from the mould

Definition statement

This place covers:

Means to facilitate the removing or ejecting of blown articles from the mould. These ejecting means are typically located in the mould.

Illustrative example of subject matter classified in this group:

{blowing pressure}

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Control of fluid pressure in general	G05D 16/00
--------------------------------------	----------------------------

B29C 2049/7831**{characterised by pressure values or ranges}****Definition statement***This place covers:*

Control of a material-shaping process including controlling blowing pressure values/ranges.

Illustrative example of subject matter classified in this group:

Fig. 8

A process wherein the pressure during the preliminary blowing phase has a value in the interval of 10 bar to 25 bar and wherein the pressure during the primary blowing phase has a value in the interval of 25 bar to 40 bar.

B29C 2049/7832**{Blowing with two or more pressure levels}****Definition statement***This place covers:*

Control of a material-shaping process including controlling blowing pressure of two or more levels.

Illustrative example of subject matter classified in this group:

FIG. 6

B29C 2049/7833

{Blowing with three or more pressure levels}

Definition statement

This place covers:

Control of a material-shaping process including controlling blowing pressure of three or more levels.

Illustrative example of subject matter classified in this group:

Fig. 7

B29C 2049/7834

{Pressure increase speed, e.g. dependent on stretch or position}

Definition statement

This place covers:

Control of a material-shaping process including controlling blowing pressure in terms of how fast/slow the pressure increases. This may depend on preform stretch or position.

Illustrative example of subject matter classified in this group:

FIG.6

FIG. 6 illustrates in a diagram the relation of a chronological blow pressure pattern 42, a stretching force development 43 as well as a stretching rod positioning 44. The scale of the time axis takes place in this case in milliseconds and the amplitude values are scaled in bar, Newton or millimeter. FIG. 6 illustrates that with respect to the positioning of the stretching rod 11, this stretching rod is initially moved essentially without development of a stretching force into the preform 1. After a contact of the stretching rod 11 at the bottom of the preform 1, the latter is stretched and a relatively great development of the stretching force takes place. After the longitudinal stretching is concluded, the remaining stretching force results from the stabilization of the preform in the stretched position while taking into consideration elastic restoring forces within the material of the preform. The blowing pressure sequence 42 shows the division into a pre-blowing phase during the carrying out of the stretching process and a principal blowing phase after a significant conclusion of the stretching procedure.

B29C 2049/7835**{Pressure reduction speed}****Definition statement***This place covers:*

Control of a material-shaping process including controlling blowing pressure in terms of how fast/slow the pressure decreases. This may depend on preform stretch or position.

Illustrative example of subject matter classified in this group:

**Fig. 8**

While blowing, the compressed air itself is preferably cooled to an adjustable temperature as well, which may be either higher or lower than zero degrees Celsius. Thus, the decrease of pressure can be faster, since the blown object has to cool less long, and the de-aeration time D thus decreases, and the production speed and the output of the blowing process increase. The decrease of pressure in area C can be obtained by successively going through more than one adjustable discrete pressure value or, when using an unlimited number of such adjustable pressure values, by running through a continuously adjustable curve, whereby the last set pressure value can amount to zero bar relative pressure in relation to the atmospheric pressure.

B29C 2049/7861**{of the preform}****Definition statement***This place covers:*

Control of a material-shaping process including controlling temperature of a preform.

Illustrative example of subject matter classified in this group:

FIG.1

Figure 1 depicts the outlet of the heating station 8, the heated preforms 22 are at a temperature comprised between the glass transition temperature of the material of the preform and its crystallization temperature, in order to obtain, at the outlet of the heating station 8, soft heated preforms 22 able to be deformed under the influence of a pressure injected inside the heated preforms 22, i.e. malleable preforms. The temperature is such that the preforms however still maintain their shape at the atmospheric pressure, meaning that they do not tend to be deformed without any pressure applied on them. As an example, for a preform made of PET in the dimensions range mentioned previously, the preform is heated at a temperature comprised between 100° C. and 140° C. It should however be noted that the more the preform has to be subjected to a greater expansion along an axial direction and/or along radial directions, the more the preform is heated at a temperature over the glass transition temperature, but without reaching the crystallization temperature, for example around 135° C. for a preform made of PET in the dimensions range mentioned previously. Consequently, for preforms having a high bi-orientation rate, defining the cumulated axial elongation and radial expansion to which the preform has to be subjected, one wants to work at the highest possible temperatures, but without crystallizing the material of the preform, in order to allow the preform to be deformed easily enough to reach the wanted shape of the container without the appearance of an overstretching of the material, possible with a temperature not high enough and/or of an high stretching rate.

The acquired images or film are then transferred to the control unit 50 and compared to the reference gauge. Furthermore, a sensor for sensing the temperature of the heated preform 22 could be provided and a formula for correcting the acceptable retraction depending on the temperature of the heated preform 22 could be applied. If one of the acquired images or one of the images of the film shows a profile of the preform radially diverging more than the reference gauge, then it is determined that the analyzed preform is unsatisfactory.

B29C 2049/7862**{characterised by temperature values or ranges}****Definition statement***This place covers:*

Control of a material-shaping process including controlling temperature of a preform in terms of temperature values or ranges.

B29C 2049/7863**{Cold blow-moulding, e.g. below T_g}****Definition statement***This place covers:*

Control of a material-shaping process including controlling temperature of a preform which includes cold blow-moulding processes, e.g. below the glass transition temperature of the preform material.

B29C 2049/7864**{of the mould}****Definition statement***This place covers:*

Control of a material-shaping process including controlling temperature of a mould.

Illustrative example of subject matter classified in this group:

**Fig-2**

A moulding machine, wherein a sensor comprises a temperature sensor for sensing the temperature of the mould.

B29C 2049/78645

{characterised by temperature values or ranges}

Definition statement

This place covers:

Control of a material-shaping process including controlling temperature of a mould in terms of temperature values or ranges.

Illustrative example of subject matter classified in this group:

Fig. 2

B29C 2049/7865

{of the stretching means, e.g. stretch rod}

Definition statement

This place covers:

Control of a material-shaping process including controlling temperature of stretching elements, e.g. stretch rod.

Illustrative example of subject matter classified in this group:

The drawing rod 15, which is made of metal, is brought into contact sequentially with the bottoms of successive hot preforms and its temperature undoubtedly rises because of these repetitive contacts; however, these contacts being only intermittent, the rod remains at all times at an average temperature substantially lower than that of the hot preforms. To give a concrete idea of this, the preforms are typically heated to a temperature of the order of 100° C. whereas the average temperature of the drawing rod remains of the order of 85° C.

B29C 2049/7867

{of the heating or cooling means}

Definition statement

This place covers:

Control of a material-shaping process including controlling temperature of the elements which provide heating or cooling.

B29C 2049/78675

{of the heating means}

Definition statement

This place covers:

Control of a material-shaping process including controlling temperature of elements which provide heating.

Illustrative example of subject matter classified in this group:

FIG. 9

FIG. 9 shows a heating chamber 4 in which temperature probes 41 are additionally provided. These can, for example, be provided in the vicinity of the recesses 4d of the feed line 14b or on the discharge line 14c of the cooling air 14. With the temperature probes 41 it is possible to monitor the temperature within the heating chambers 4. Similarly, it is conceivable that with the aid of the temperature probes 41 and a suitable control device the amount of cooling air introduced into the heating chamber 4 can be controlled, in particular with convection driven by a blower. However, this would also be possible with free convection. A temperature control can also be used to stabilise the heat distribution in the preform and/or to compensate differences between individual heating chambers 4 or preforms 5. It is also conceivable to regulate the amount of air to be introduced in dependence of a measured final temperature after heating the preform and/or to mix discharged cooling air 14 for temperature control at least partly with the cooling air 14 to be fed in and/or to pass the discharged cooling air 14 to a heat exchanger for heat extraction in another process.

With the aid of temperature probes 41 the temperature in the heating chambers 4, in particular after closing the lid 21 with the heating chamber 4 uncharged, can be set to a constant value or to a uniform output temperature for heating the preforms 5.

B29C 2049/7868

{of the articles}

Definition statement

This place covers:

Control of a material-shaping process including controlling temperature of the formed article.

B29C 2049/78705

{of a layer, e.g. intermediate layer}

Definition statement

This place covers:

Control of a material-shaping process including controlling thickness of a preform in terms of the particular thickness of a layer within the preform.

Illustrative example of subject matter classified in this group:

FIG. 2

FIG. 3

FIG. 4

FIG. 5

FIG. 6

FIG. 7

As seen in Figures 2-7, a laminated and moulded body obtained by coextruding and moulding at least two kinds of resin materials. At least one layer of said laminated and moulded body comprises a coloured layer having a thickness continuously or intermittently varied in a predetermined direction with respect to the extruding direction of the resin material of said coloured layer, wherein the predetermined direction preferably is a direction parallel to the extruding direction of said at least one layer of said laminated and moulded body or preferably the predetermined direction is a direction intersecting the extruding direction of said at least one layer of said laminated and moulded body or preferably the predetermined direction comprises a direction parallel to the extruding direction of said at least one layer of said laminated and moulded body and another direction intersecting the extruding direction, wherein preferably the full thickness of said laminated and moulded body is substantially constant along said predetermined direction, wherein preferably said coloured layer has a thickness varied within a range of 50% of the full thickness of said laminated and moulded body.

B29C 2049/7871**{of the extruded preform thickness}****Definition statement***This place covers:*

Control of a material-shaping process including controlling thickness of a preform in terms of the thickness of the preform as-extruded.

B29C 2049/78715**{of the blown article thickness}****Definition statement***This place covers:*

Control of a material-shaping process including controlling thickness of a preform in terms of the thickness of the blown article.

Illustrative example of subject matter classified in this group:

Figure 1 shows machine control features connected to moulding devices for a thickness monitor that generates a thickness signal representing an average wall thickness of the container; and a system control connected to said thickness monitor and being responsive to said thickness signal for generating a control signal, a control signal for adjusting operation of the moulding devices based upon average wall thickness, such that the system control responds to feedback signals generated by the moulding devices by adjusting operation of the moulding devices.

B29C 2049/7873**{Extrusion speed; Extruded preform position or length; Extrusion fall speed}****Definition statement***This place covers:*

Control of a material-shaping process including controlling extrusion speed, such as extrudate position, length, or fall speed.

B29C 2049/7874**{Preform or article shape, weight, defect or presence}****Definition statement***This place covers:*

Control of a material-shaping process including controlling preform attributes of shape, weight, or presence of defect.

Illustrative example of subject matter classified in this group:

This figure depicts detecting, from at least some of the blow-moulded containers in the production process, the axial location of the indicator relative to a control location; determining for the at least some blow-moulded containers a material distribution outcome based on the detected axial locations of each indicator accumulating data representative of the material distribution outcome for a group of containers; computing an average material distribution characteristic for the group of containers; classifying the average material distribution characteristic for the group of containers in one of a pre-defined set of classes; and providing a signal based on the classification.

B29C 2049/78745**{Weight or density}****Definition statement***This place covers:*

Control of a material-shaping process including controlling preform attributes of weight or density.

B29C 2049/7875**{Size or shape}****Definition statement***This place covers:*

Control of a material-shaping process including controlling preform attributes of size or shape.

B29C 2049/7876**{Defects}****Definition statement***This place covers:*

Illustrative example of subject matter classified in this group:

Fig. 1

B29C 2049/78765**{Presence, e.g. of the preform in the mould}****Definition statement***This place covers:*

Control of a material-shaping process including controlling preform attributes of a presence of a defect in the preform.

B29C 2049/7878**{Preform or article handling, e.g. flow from station to station}****Definition statement***This place covers:*

Measuring, controlling, or regulating the movement and/or handling or preforms, parisons, or articles from one location to another location along a process flow direction.

Illustrative example of subject matter classified in this group:

B29C 51/00

Shaping by thermoforming {, i.e. shaping sheets or sheet like preforms after heating}, e.g. shaping sheets in matched moulds or by deep-drawing; Apparatus therefor {(blow moulding of tubular preforms [B29C 49/00](#), deforming of tubular or hollow preforms [B29C 67/0014](#))}

Definition statement

This place covers:

- shaping of materials in a plastic state by thermoforming
- simulation of thermoforming
- honeycomb structures sheets which are thermoformed with thermoplastic sheets surrounding it as long as the thermoplastic sheets are plastically deformed,
- plates or sheets which are clamped in such a way that they can at least partially slide into the mould when thermoformed

Special rules of classification

- For articles and materials, as much as possible additional classification by adding the Indexing Codes of [B29K](#) and [B29L](#) is recommended.

- If more than 4 different thermoplastic materials are described in the disclosure then the Indexing Code [B29K 2101/12](#) should be allocated. In addition only up to 4 of the disclosed uncommon thermoplastic materials are classified (common thermoplastics for thermoforming are PET, PE, PP) by allocating the appropriate Indexing Code as provided in [B29K 2001/00](#) - [B29K 2101/00](#).

- Inventive and additional information disclosed in documents to be classified should be identified by allocation the appropriate classification codes of [B29C 51/00](#) - [B29C 51/46](#). In particular attention should be paid to the so called break down Indexing Codes, which are only present at additional information level, but should be allocated if disclosed in the document to be classified.

- If during thermoforming a vacuum, a vacuum and pressure or a pressure is used then one or both of the following classification codes should additionally be allocated: [B29C 2791/006](#) and/or [B29C 2791/007](#).

B29C 51/002

B29C 51/082

{by shaping between complementary mould parts}

Definition statement

This place covers:

- WO9728942

WO 9728942

1/3

PCT

B29C 51/085

{with at least one of the shaping surfaces being made of resilient material, e.g. rubber}

Definition statement

This place covers:

- FR2640545

B29C 51/087

{with at least one of the mould parts comprising independently movable sections ([B29C 51/32](#) and [B29C 51/34](#) take precedence)}

Definition statement

This place covers:

Fig. 3

Fig. 4

B29C 51/10

Forming by pressure difference, e.g. vacuum

Definition statement

This place covers:

EP 1 114 715 A1

B29C 51/105

{Twin sheet thermoforming, i.e. deforming two parallel opposing sheets or foils at the same time by using one common mould cavity and without welding them together during thermoforming ([B29C 51/267](#), [B29C 49/0691](#) take precedence)}

Definition statement

This place covers:

-thermoforming processes, whereby two sheets are deformed at the same time by pressure or vacuum in one combined mould cavity, but they are not welded together either before or during the thermoforming operation

B29C 51/12

of articles having inserts or reinforcements

Definition statement

This place covers:

JP61193830

Special rules of classification

When details of inserts are indicated, then it is highly desirable to allocate additionally the following Indexing Codes for additional information:

- [B29K 2601/00](#) - [B29K 2713/02](#)

B29C 51/14

using multilayered preforms or sheets

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Layered products comprising thermoplastic sheets per se	B32B 27/00
---	----------------------------

Special rules of classification

- Thermoformed articles which are decorated with paint or sheets with a paint layer are additionally classified by adding the Indexing Code: [B29L 2031/722](#)

B29C 51/16

Lining or labelling

Definition statement

This place covers:

Thermoforming process whereby the lining must be heated and deformed during the lining operation.

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Lining or sheathing in general	B29C 63/00
Producing of labels	B31D 1/02
Labelling in general, other then flat surfaces	B65C 3/00
In mould labelled containers	B65D 23/0864
Labels in general e.g. for thermo adhesion	G09F 3/04

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Lining	Covering the whole outer and/or inner surface of articles with a heated thermoplastic sheet. The heated sheet is stretched and three dimensionally deformed.
Labelling	Connecting a label, which is for example on the inside of a mould cavity, to a heated preform or sheet while the preform or sheet is thermoformed. Often also called "in mould labelling"

B29C 51/162

{of deep containers or boxes}

Definition statement

This place covers:

Patent Application Publication Oct. 31, 2002 Sheet 2 of 3 US 2002/0157763 A1

B29C 51/165

{combined with the feeding or the shaping of the lining or the labels (by injection moulding [B29C 45/14008](#), [B29C 45/1418](#))}

Definition statement

This place covers:

- FR2613982

FIG. 4

References**Informative references**

Attention is drawn to the following places, which may be of interest for search:

Label feeding in general	B65C 9/08
--------------------------	---------------------------

B29C 51/167

{of a continuous strip}

Definition statement

This place covers:

- US2482558

B29C 51/20

having movable moulds or mould parts

Definition statement

This place covers:

US4105736

B29C 51/22

rotatable about an axis

Definition statement

This place covers:

- FR2911537

**B29C 51/225**

{mounted on a vacuum drum (for surface shaping [B29C 59/06](#))}

Definition statement

This place covers:

- Vacuum, pressure or match mould deforming as long as it is mounted on a drum

-WO2004113073

B29C 51/26

Component parts, details or accessories; Auxiliary operations

FIG. 3

B29C 51/425

{using movable heating devices}

Definition statement

This place covers:

B29C 51/427

{Cooling of the material with a fluid blast}

Definition statement

This place covers:

B29C 51/428**{of moulds or mould parts}****Definition statement***This place covers:*

U.S. Patent

Apr. 8, 1997

Sheet 6 of 12

5,618,486

References**Informative references***Attention is drawn to the following places, which may be of interest for search:*

Heating or cooling of moulds in general	B29C 33/02 - B29C 33/08
---	---

Special rules of classification

- If the heating or cooling system applied in the thermoforming mould is of general interest, then additional classification in the general groups [B29C 33/02](#) - [B29C 33/08](#) is recommended.

B29C 51/44**Removing or ejecting moulded articles****Definition statement**

This place covers:

Contains also stacking of articles

DE 10 2008 019 988 B3 2009.06.25

**References****Informative references**

Attention is drawn to the following places, which may be of interest for search:

Moulds with means for to facilitate the removal of articles	B29C 33/44
Stacking of nested articles	B65G 57/165

B29C 51/445

{from a support after moulding, e.g. by cutting}

Definition statement

This place covers:

**B29C 53/00**

Shaping by bending, folding, twisting, straightening or flattening; Apparatus therefor (**B29C 61/10** takes precedence)

References**Informative references**

Attention is drawn to the following places, which may be of interest for search:

Lining or sheathing by winding sheet or web-like material helically	B29C 63/08
Lining or sheathing by winding sheet or web-like material spirally	B29C 63/12
Covering or wrapping cores by winding webs, tapes or filamentary material	B65H 81/00

B29C 53/18

of plates or sheets

References**Informative references**

Apparatus for taking-out curl from webs	B65H 23/34
---	----------------------------

B29C 53/56

Winding and joining, e.g. winding spirally {(winding in general [B65H](#))}

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Spirally	the successive turns are completely overlapping each other
----------	--

Helically	the successive turns are partially overlapping each other
-----------	---

B29C 55/00

Shaping by stretching, e.g. drawing through a die; Apparatus therefor (B29C 61/08 takes precedence)

Definition statement

This place covers:

Documents describing shaping by stretching, drawing, orienting polymeric articles like films, sheets, webs, tapes, ribbons, bands, strips, slabs, plates, plaques, boards, tubes, hoses etc.

The subgroups define the mechanical and geometrical ways in which stretching is performed.

References

Limiting references

This place does not cover:

Manufacture of films or sheets characterised by the chemical composition	C08J 5/18
Stretching of fibres, filaments, threads and the like and of textile fabrics	D01D , D06C

Informative references

Attention is drawn to the following places, which may be of interest for search:

Membranes produced by stretching	B01D 67/0025
Producing films characterised by special physical or application properties (e.g. translucent films for light diffusion)	B29D 7/01
Film laminates	B32B 27/00
Stretch wrapping	B65B 11/00

B29C 57/00

Shaping of tube ends, e.g. flanging, belling or closing; Apparatus therefor {, e.g. collapsible mandrels}

References

Limiting references

This place does not cover:

Shaping a tube locally and then cutting in the deformed area, so that two tubes with shaped ends are obtained	B29C 67/0014
---	------------------------------

Informative references

Attention is drawn to the following places, which may be of interest for search:

Forming the tip of catheters	A61M 25/001
Altering the diameter of tube ends	B21D 41/00

Shaping paper or cardboard tube ends	B31F 1/008
--------------------------------------	----------------------------

B29C 59/00

Surface shaping {of articles}, e.g. embossing; Apparatus therefor {(in-mould printing [B29C 37/0025](#); by using liquids [B29C 71/0009](#); by using gases without chemical reaction [B29C 71/009](#); for decorating in general [B44](#); abrasive blasting [B24C](#); chemical aspects [C08J 7/00](#))}

References

Limiting references

This place does not cover:

Photomechanical, e.g. photolithographic, production of textured or patterned surfaces, e.g. printing surfaces, lithographic processes using patterning methods other than those involving the exposure to radiation, e.g. by stamping	G03F 7/0002
---	-----------------------------

Informative references

Attention is drawn to the following places, which may be of interest for search:

Moulding articles characterized by the shape of the surface	B29C 37/0053
Shapping composites, comprising fillers only, the filler influencing the surface characteristics of the material, e.g. by concentrating near the surface or by incorporating in the surface by force	B29C 70/64
Absorbent pads, characterised by the outer layer being three-dimensional, e.g. embossed, textured	A61F 13/51476
Producing rollers or cylinders having an axial length of several times the diameter, e.g. for embossing, pressing or printing	B29D 99/0035
Basic electric elements such as spark gaps; overvoltage arresters using spark gaps; sparking plugs; corona devices	H01T
Plasma technique	H05H

B29C 59/002

{Component parts, details or accessories; Auxiliary operations}

B29C 64/00

Additive manufacturing, i.e. manufacturing of three-dimensional [3D] objects by additive deposition, additive agglomeration or additive layering, e.g. by 3D printing, stereolithography or selective laser sintering

Definition statement

This place covers:

Technologies involving the use or application of processes or apparatus that produce three-dimensionally shaped structures by selectively depositing successive layers of material one upon another. In particular it covers processes, apparatus and other aspects of additive manufacturing, i.e., making, repairing, or modifying articles of manufacture by the selective application of multiple layers of material. The applied layers may be applied directly, as in a printing process, or by selective solidification of material onto a substrate or previously developed layers, for example, by selective sintering of a particulate.

Relationships with other classification places

This group [B29C 64/00](#) covers additive manufacturing of plastics or materials in a plastic state, not otherwise provided for.

The subclass [B33Y](#) covers additive manufacturing, irrespective of the process or material used. Furthermore, the subclass [B33Y](#) is for obligatory supplementary classification of subject matter containing an aspect of additive manufacturing already classified as such in other classification places.

References

Manipulating 3D models or images for computer graphics	G06T 19/00
Geography, e.g. relief models	G09B 25/06
Electron-beam or ion-beam tubes for localised application of thin layers on objects	H01J 37/317

Manufacture of semiconductor or otherwise not provided for electric solid state devices	H01L 21/00
Manufacturing printed circuits by printing of conductive patterns	H05K 3/12

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

3D printing	Additive manufacturing where the buildup of successive layers of material includes the use of a printer-like device having a motor controlled head for dispensing materials that form the layers.
Stereolithography	Additive manufacturing technique where the successive layers of material are formed by selectively hardening regions of polymeric material successively applied to the structure, typically by the use of laser light.

Synonyms and Keywords

In patent documents, the following abbreviations are often used:

SLS	Selective laser sintering
DTM	Desktop manufacturing
LOM	Laminated Object Modelling
3DP, 3D-printing	Three-dimensional printing
SFF	Solid Freeform Fabrication
FDM	Fused Deposition Modelling
3DD	Three-dimensional deposition
SDM	Selective Deposition Modelling
LDM	Layered deposition modelling
3DM	Three-dimensional modelling
BPM	Ballistic Particle Modelling

B29C 64/10

Processes of additive manufacturing

Relationships with other classification places

Additive manufacturing should obligatorily be further be classified in subclass [B33Y](#) irrespective of the process or material used.

B29C 64/106

using only liquids or viscous materials, e.g. depositing a continuous bead of viscous material

Definition statement

This place covers:

e.g. extruding thermoplastic material.

B29C 64/129

characterised by the energy source therefor, e.g. by global irradiation combined with a mask

Definition statement

This place covers:

Patent Application Publication Jul. 20, 2006 Sheet 1 of 2 US 2006/0161287 A1

Synonyms and Keywords

In patent documents, the following abbreviations are often used:

LCD	Liquid Crystal Display
MMD	Micromirror Devices

B29C 64/135

the energy source being concentrated, e.g. scanning lasers or focused light sources

Definition statement

This place covers:

EP 1 645 402 A1

B29C 64/141

using only solid materials

Definition statement

This place covers:

Patent Application Publication Oct. 1, 2009 Sheet 10 of 10 US 2009/0246436 A1

B29C 64/153

using layers of powder being selectively joined, e.g. by selective laser sintering or melting

Definition statement

This place covers:

DE 10 2005 022 308 A1 2006.11.23

Anhängende Zeichnungen

**References****Informative references**

Attention is drawn to the following places, which may be of interest for search:

laser sintering of metallic powder	B22F 10/20
laser sintering of ceramic powder	C04B 35/64 and C04B 35/65

B29C 64/165

using a combination of solid and fluid materials, e.g. a powder selectively bound by a liquid binder, catalyst, inhibitor or energy absorber

Definition statement

This place covers:

Patent Application Publication Feb. 25, 2010 Sheet 1 of 4 US 2010/0044903 A1

**B29C 64/20**

Apparatus for additive manufacturing; Details thereof or accessories therefor

Definition statement

This place covers:

- Machines and systems for carrying out additive manufacturing methods to produce objects
- Subcombinations of machines that carry out additive manufacturing methods to produce objects
- Accessories for machines that carry out additive manufacturing methods. Accessories include things attachable to or used in conjunction with an additive manufacturing machine that have a direct association with the additive manufacturing machine, per se.

Relationships with other classification places

Auxiliary operations or equipment, e.g. for treating or handling the raw materials for additively manufacturing objects, are classified in [B29C 64/30](#).

Additive manufacturing should obligatorily be further be classified in subclass [B33Y](#) irrespective of the process or material used.

B29C 64/30

Auxiliary operations or equipment

Definition statement

This place covers:

The handling or treating of materials used in an additive manufacturing process, or the subsequent treating or handling of objects produced by an additive manufacturing process. Also covered are ancillary components or process steps not directly involving the additive manufacturing process or apparatus, per se, such as cleaning raw materials used in the additive manufacturing process, or recycling residual material from the manufacturing process.

Relationships with other classification places

Additive manufacturing should obligatorily be further be classified in subclass [B33Y](#) irrespective of the process or material used.

B29C 64/35

Cleaning

Definition statement

This place covers:

Patent Application Publication Mar. 22, 2007 Sheet 3 of 3 US 2007/0063366 A1

References

Informative references

Cleaning by vacuum in general	B08B 5/04

B29C 64/386

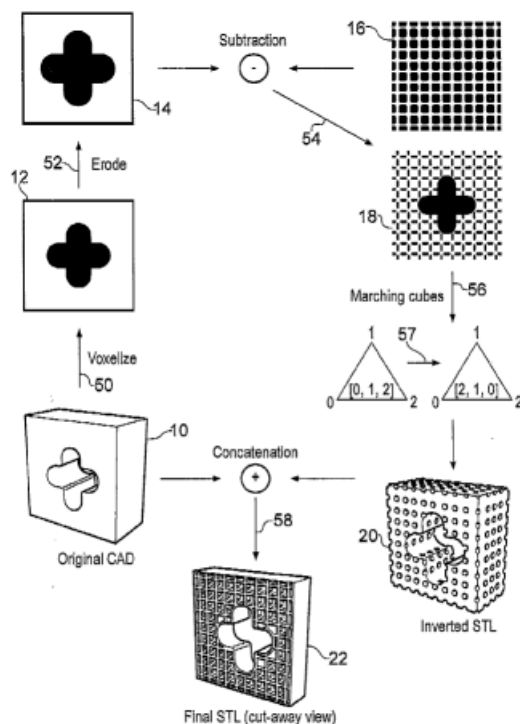

Data acquisition or data processing for additive manufacturing

Definition statement

This place covers:

- Data processing aspects related to an object to be manufactured in an additive manufacturing process, specially adapted for processing of plastics or materials in a plastic state, not otherwise provided for, for example, combining together data from different sources to produce composite production data for said object to be made.
- Acquiring, sending, or receiving data that will be used in additive manufacturing, either internal or external to the additive manufacturing apparatus, specially adapted for processing of plastics or materials in a plastic state, not otherwise provided for.

Illustrative example of subject matter classified in this group:

Relationships with other classification places

Additive manufacturing should obligatorily be further be classified in subclass [B33Y](#) irrespective of the process or material used.

B29C 64/393

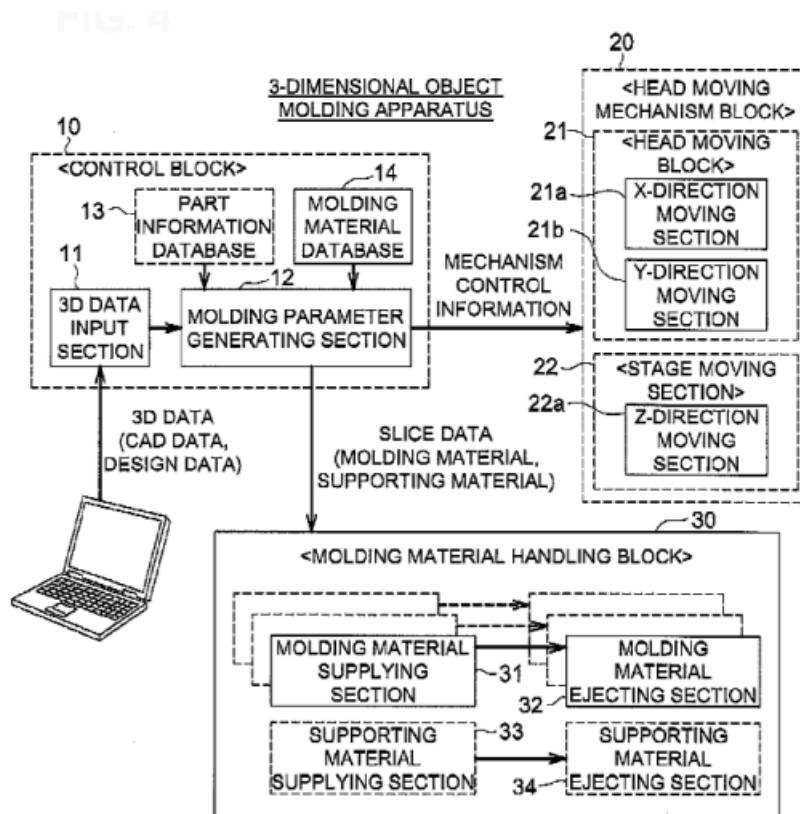

for controlling or regulating additive manufacturing processes

Definition statement

This place covers:

Data processing specially adapted for managing the additive manufacturing process performed by one or more additive manufacturing apparatuses, specially adapted for processing of plastics or materials in a plastic state, not otherwise provided for.

Illustrative example of subject matter classified in this group:

**Relationships with other classification places**

Additive manufacturing should obligatorily be further be classified in subclass [B33Y](#) irrespective of the process or material used.

B29C 64/40

Structures for supporting 3D objects during manufacture and intended to be sacrificed after completion thereof

Definition statement

This place covers:

FIG. 2

Parent Application Publication Mar. 19, 2009 Sheet 2 of 28 US 2009/0072447 A1

B29C 65/00

Joining {or sealing} of preformed parts {, e.g. welding of plastics materials}; Apparatus therefor {(general aspects of processes or apparatus for joining preformed parts [B29C 66/00](#); using porous material formed by internal pressure generated therein for joining preformed parts [B29C 44/1228](#), [B29C 44/326](#))}

Definition statement

This place covers:

Joining by heating (cf. [B29C 65/02](#) and subgroups);

Joining using adhesives (cf. [B29C 65/48](#) and subgroups);

Joining using mechanical means (cf. [B29C 65/56](#) and subgroups);

Joining and severing (cf. [B29C 65/74](#) and subgroups);

Means for handling the parts to be joined (cf. [B29C 65/78](#) and subgroups);

Testing the joints obtained by processes as foreseen in this main group (cf. [B29C 65/82](#) and subgroups).

References

Limiting references

This place does not cover:

General aspects of processes or apparatus for joining preformed parts	B29C 66/00
---	----------------------------

Application-oriented references

Examples of places where the subject matter of this place is covered when specially adapted, used for a particular purpose, or incorporated in a larger system:

Devices or methods of sealing or securing package folds or closures	B65B 51/00
---	----------------------------

Informative references

Attention is drawn to the following places, which may be of interest for search:

Manufacture of lost patterns, made from expanded plastic materials, by assembling preformed parts	B22C 7/026
Making preforms by assembling performed material	B29B 11/04
Making of boxes, cartons, envelopes, or bags	B31B
Assembling of microstructural devices by bonding of two components	B81C 3/00
Chemical aspects of bonding of a preformed macromolecular material to the same or other solid material	C08J 5/12
Adhesive processes in general	C09J 5/00
Devices for fastening or securing constructional elements or machine parts together	F16B
Splicing of light guides	G02B 6/255

Special rules of classification

Patent literature (e.g. patent applications, patent specifications):

Claims / claimed subject-matter:

Independent claims: compulsory invention information;

Dependent claims: at least compulsory additional information (or compulsory invention information if appropriate).

Figures - depicted subject-matter: at least compulsory additional information (or compulsory invention information if appropriate).

Description - described subject-matter: at least desirable additional (or compulsory invention information if appropriate).

Tables: at least compulsory additional information.

Non-patent literature (e.g. scientific non-patent publications):

Figures - depicted subject-matter: compulsory invention information;

Abstract: compulsory invention information;

Description: at least desirable additional information (or compulsory invention information if appropriate).

N.B.: in this main group, it is compulsory that any disclosed aspect relating to the invention is identified by the corresponding classification code(s).

B29C 65/004

{Cold joining}

WO9214601:

B29C 65/229

{characterised by the means for tensioning said heated wire, resistive ribbon, resistive band or resistive strip (means for compensating for the thermal expansion of welding jaws in general [B29C 66/8185](#))}

Definition statement

This place covers:

Example 1, from

US3005402:

B29C 65/242

{the heat transfer being achieved by contact, i.e. a heated tool being brought into contact with the welding tool and afterwards withdrawn from it}

Definition statement

This place covers:

Example 1, from

EP0538636:

B29C 65/245

{the heat transfer being achieved contactless, e.g. by radiation ([B29C 65/32](#) takes precedence)}

Definition statement

This place covers:

Example 1, from

CH362216:

Example 2, from

DE19746402:

B29C 65/26

Hot fluid

Definition statement

This place covers:

Example 1, from

FR1151122:

B29C 65/28

Flame or combustible material

Definition statement

This place covers:

Example 1, from

CH334038:

Example 2, from

DE2241657:

B29C 65/30

Electrical means {(B29C 65/38 takes precedence)}

Definition statement

This place covers:

Example 1, from

FR1422754:

**B29C 65/305**

{involving the use of cartridge heaters}

Definition statement

This place covers:

Example 1, from

US4451325:

B29C 65/32

Induction

Definition statement

This place covers:

Example 1, from

DE19921546:

B29C 65/34

using heated elements which remain in the joint, e.g. "verlorenes Schweisselement"

References

B29C 65/342

{comprising at least a single wire, e.g. in the form of a winding}

Definition statement

This place covers:

Example 1, from

DE3411179:

Example 2, from
JP6074386:

【図7】

B29C 65/3424

{said at least a single wire having the form of a coil spring}

Definition statement

This place covers:

Example 1, from

FR1049710:

B29C 65/3428

{said at least a single wire having a waveform, e.g. a sinusoidal form}

Definition statement

This place covers:

Example 1, from

FR2182587:

B29C 65/3432

{comprising several wires, e.g. in the form of several independent windings
([B29C 65/3436](#), [B29C 65/344](#) take precedence)}

Definition statement

This place covers:

Example 1, from

DE3411179:

B29C 65/344

{being a woven or non-woven fabric or being a mesh}

Definition statement

This place covers:

Example 1, from

FR1072800:

B29C 65/3444

{being a ribbon, band or strip}

Definition statement

This place covers:

Example 1, from

FR1072800:

B29C 65/3448

{said ribbon, band or strip being perforated}

Definition statement

This place covers:

Example 1, from

FR1072800:

B29C 65/3452

{forming a sleeve, e.g. a wrap-around sleeve}

{In-line machines, i.e. feeding, joining and discharging are in one production line ([B29C 65/7879](#), [B29C 65/7888](#) take precedence)}

Definition statement

This place covers:

Example 1, from

DE4336274:

FIG.1

B29C 65/7864

{using a feeding table which moves to and fro (oscillating around an axis [B29C 65/7876](#))}

Definition statement

This place covers:

Example 1, from

JP11240025:

【図1】

B29C 65/7867

{using carriers, provided with holding means, said carriers moving in a closed path}

Definition statement

This place covers:

Example 1, from

EP0483569:

Example 2, from
DE1058426:

B29C 65/787

{using conveyor belts or conveyor chains ([B29C 66/83421](#), [B29C 66/83521](#), [B29C 66/83531](#) take precedence)}

Definition statement

This place covers:

Example 1, from

DE3807164:

**B29C 65/7879**

{said parts to be joined moving in a closed path, e.g. a rectangular path ([B29C 65/7888](#) takes precedence)}

Definition statement

This place covers:

Example 1, from

DE102009037662:

B29C 65/7882

{said parts to be joined moving in a circular path}

Definition statement

This place covers:

Example 1, from

CH537834:

Example 2, from

DE1143630:

B29C 65/7885

{Rotary turret joining machines, i.e. having several joining tools moving around an axis}

Definition statement

This place covers:

Example 1, from

FR2167559:

Special rules of classification

Patent literature (e.g. patent applications, patent specifications):

Claims / claimed subject-matter:

Independent claims: compulsory invention information;

Dependent claims: at least compulsory additional information (or compulsory invention information if appropriate).

Figures - depicted subject-matter: at least compulsory additional information (or compulsory invention information if appropriate).

Description - described subject-matter: at least desirable additional (or compulsory invention information if appropriate).

Tables: at least compulsory additional information.

Non-patent literature (e.g. scientific non-patent publications):

Figures - depicted subject-matter: compulsory invention information;

Abstract: compulsory invention information;

Description: at least desirable additional information (or compulsory invention information if appropriate).

N.B.: in this main group, it is compulsory that any disclosed aspect relating to the invention is identified by the corresponding classification code(s).

FIG. 5B

B29C 66/05

{Particular design of joint configurations}

Special rules of classification

In this group the possible supplementary joining material (e.g. adhesive, adhesive tapes or extra joining elements, e.g. extra riveting elements) is not taken into account for the joint configuration. The use of supplementary joining material (e.g. adhesive, adhesive tapes or extra joining elements, e.g. extra riveting elements) has to be additionally classified as such (e.g. in [B29C 65/48](#) and subgroups, [B29C 65/50](#) and subgroups, [B29C 65/562](#) and subgroups or [B29C 65/601](#) and subgroups).

B29C 66/10

{particular design of the joint cross-sections}

Definition statement

This place covers:

Example 1, [B29C 66/112](#) (single lapped joint) and [B29C 66/131](#) (single flanged joint), from

JP2009202894:

Example 2, [B29C 66/135](#) (single hemmed joint) and [B29C 66/112](#) (single lapped joint), from

EP0721745:

Example 3, [B29C 66/135](#) (single hemmed joint) and [B29C 66/112](#) (single lapped joint), from

Definition statement

JP8118499:

B29C 66/11

{Joint cross-sections comprising a single joint-segment, i.e. one of the parts to be joined comprising a single joint-segment in the joint cross-section (B29C 66/12 and subgroups take precedence)}

Definition statement

This place covers:

Example 2, [B29C 66/112](#) (single lapped joint) and [B29C 66/114](#) (single butt joint), from

NL1028543C:

Example 3, [B29C 66/116](#) (single bevelled joint) and [B29C 66/112](#) (single lapped joint), from

This place covers:

Example 1, from

EP0783956:

B29C 66/234

{said joint lines being in the form of tessellations}

Definition statement

This place covers:

Example 1, from

US4265954:

B29C 66/24221

{being circular ([B29C 66/51](#) takes precedence)}

Definition statement

This place covers:

Example 1, from

EP2364836:

FIG. 2A

FIG. 2B

B29C 66/24223

{being oval}

Definition statement

This place covers:

Example 1, from

US2010326113:

B29C 66/24241

{forming a triangle}

Definition statement

This place covers:

Example 1, from

US3667593:

B29C 66/24244

{forming a rectangle}

Definition statement

This place covers:

Example 1, from

GB2394690:

B29C 66/24245**{forming a square}****Definition statement***This place covers:*

Example 1, from

JP60137630:

**B29C 66/24249****{forming a specific polygon not provided for in [B29C 66/24241](#) - [B29C 66/24243](#)}****Definition statement***This place covers:*

Example 1, from

EP1516816:

B29C 66/244

{said joint lines being non-straight, e.g. forming non-closed contours}

Definition statement

This place covers:

Example 1, from

EP0343629:

Example 2, from

JP52098783:

B29C 66/2442

{in the form of a single arc of circle}

Definition statement

This place covers:

Example 1, from

EP0343629:

Example 2, from

JP52098783:

B29C 66/246

{said joint lines forming figures, e.g. animals, flowers, hearts}

Definition statement

This place covers:

Example 1, from

JP62023728:

B29C 66/301

{Three-dimensional joints, i.e. the joined area being substantially non-flat
([B29C 66/5223](#), [B29C 66/5224](#), [B29C 66/5225](#) take precedence)}

Definition statement

This place covers:

Example 1, from

JP2000294012:

B29C 66/30221

{said melt initiators being point-like}

Definition statement

This place covers:

Example 1, from

JP63023237:

B29C 66/30223

{said melt initiators being rib-like}

Definition statement

This place covers:

Example 1, from

JP2004202828:

**B29C 66/3024**

{said melt initiators being non-integral with the parts to be joined}

Definition statement

This place covers:

Example 1, from

EP0301831:

FIG. 11

FIG. 13

B29C 66/303

{the joint involving an anchoring effect ([B29C 66/341](#), [B29C 65/56](#) and subgroups take precedence)}

JP4191592:

B29C 66/52298

{said socket being composed by several elements}

Definition statement

This place covers:

Example 1, from

DE19519341:

Example 2, from
JP5240394:

B29C 66/5241

{for forming coaxial connections, i.e. the profiled elements to be joined forming a zero angle relative to each other}

Definition statement

This place covers:

Example 1, from

WO0189811:

Fig.1

Fig.2

B29C 66/5243

{for forming corner connections, e.g. for making window frames or V-shaped pieces (welded corner joints for window frames [E06B 3/9604](#))}

Definition statement

This place covers:

Example 1, from

EP2233391:

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Welded corner joints for windows, doors, or the like frames or wings	E06B 3/9604
--	-----------------------------

B29C 66/52431

{with a right angle, e.g. for making L-shaped pieces}

Definition statement

This place covers:

Example 1, from

DE102007055393:

B29C 66/5244

{for forming fork-shaped connections, e.g. for making window frames or Y-shaped pieces}

Definition statement

This place covers:

Example 1, from

FR2712345:

**B29C 66/52441**

{with two right angles, e.g. for making T-shaped pieces}

Definition statement

This place covers:

Example 1, from

DE20206377U:

Fig. 1a

Fig. 1b

Fig. 2

Example 2, from
 FR2712345:

FIG. 1

FIG. 2

B29C 66/52451

{with four right angles, e.g. for making +-shaped pieces}

Definition statement

This place covers:

Example 1, from

US3707062:

B29C 66/53243

{said spouts comprising flanges}

Definition statement

This place covers:

Example 1, from

EP1314539:

B29C 66/53246

{said single elements being spouts, e.g. joining spouts to containers}

Definition statement

This place covers:

Example 1, from

US4872935:

Example 2, from
EP1939509:

This place covers:

Example 1, from

WO9516557:

FIG. 1.

B29C 66/91933

{higher than said fusion temperature}

Special rules of classification

Documents merely stating that the welding occurs above the melting temperature of the parts to be joined do not belong to this class.

Documents specifying the welding temperature by giving actual values, e.g. absolute or in relation to the melting temperature, do belong to this class

B29C 67/00

Shaping techniques not covered by groups [B29C 39/00](#) - [B29C 65/00](#),
[B29C 70/00](#) or [B29C 73/00](#)

Definition statement

This place covers:

e.g. plants for moulding, curing or finishing articles, e.g. disposable plants, plants mounted on vehicles; e.g. lay-out of plants or machines, e.g. arrangement, sequence or exchange of machines, machine parts or tools not otherwise provided for; e.g. modular plants or machines, i.e. plants or machines build up from modular parts

B29C 69/00

Combinations of shaping techniques not provided for in a single one of main groups [B29C 39/00](#) - [B29C 67/00](#), e.g. associations of moulding and joining techniques; Apparatus therefore {([B29C 48/001](#) takes precedence)}

Relationships with other classification places

The group [B29C 69/00](#) and its subgroups cover combination(s) of shaping techniques not otherwise provided for in [B29C](#), where the invention lies in the combination of techniques - not in the single technique as such - and wherein the invention is related to a shaping problem.

Documents not relating to a shaping problem do not belong to this group. For instance, documents relating to combined operations for making a particular article, which involves a mere combination of moulding steps, but failing to relate to a moulding problem as such, do not belong to this group; such documents do belong to the relevant [B29D](#) entry, if such entry exists, and if not then to the relevant product/article entry.

References

Limiting references

This place does not cover:

B29C 69/004

{making articles by joining parts moulded in separate cavities, said parts being in said separate cavities during said joining ([B29C 45/006](#), [B29C 51/267](#) take precedence)}

Relationships with other classification places

Documents classified in this group relate to a joining problem. Documents not relating to a joining problem do not belong to this group. For instance, documents relating to combined operations for making a particular article, which involves a mere combination of the step of moulding parts in separate cavities and the step of joining said parts, but failing to relate to a joining problem as such, do not belong to this group; such documents do belong to the relevant [B29D](#) entry, if such entry exists, and if not then to the relevant product/article entry.

B29C 69/005

{cutting-off or cutting-out a part of a strip-like or sheet-like material, transferring that part and fixing it to an article (if labeling see [B65C](#), in combination with box-making [B31B 50/81](#); labelling in general [B65C](#))}

Relationships with other classification places

Documents classified in this group relate to a joining problem. Documents not relating to a joining problem do not belong to this group. For instance, documents relating to combined operations for making a particular article, which involves a mere combination of the step of cutting-off or cutting-out a part of a strip-like or sheet-like material, the step of transferring said part and the step of fixing said part to an article, but failing to relate to a joining problem as such, do not belong to this group; such documents do belong to the relevant [B29D](#) entry, if such entry exists, and if not then to the relevant product/article entry.

B29C 70/00

Shaping composites, i.e. plastics material comprising reinforcements, fillers or preformed parts, e.g. inserts

References

Informative references

Attention is drawn to the following places, which may be of interest for search:

Nanotechnology for materials or surface science, e.g. nanocomposites	B82Y 30/00

Alloys containing metallic or non-metallic fibres or filaments	C22C 49/00
Testing of composites	G01N 25/72
CAD/CAM	G06F 30/00

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Fibre or fiber	General expression for a reinforcement in the form of a bundle of filaments.
Filament	Single reinforcing body of high aspect ratio, typically produced artificially by pressing a fluid through a small diameter orifice (spinneret) and allowing the fluid to solidify after leaving the spinneret and being subjected to cooling, drying or a chemical reaction. The filament can also come from a natural source (single filament of a plant or animal fibre).
Roving	Bundle of fibres or collection of a large number of filaments resulting in a bundle of substantially higher cross section than that of a single fibre.
Whisker	Typically a short length filament.

B29C 70/02

comprising combinations of reinforcements, {e.g. non-specified reinforcements, fibrous reinforcing inserts} and fillers, {e.g. particulate fillers}, incorporated in matrix material, forming one or more layers and with or without non-reinforced or non-filled layers {(combinations of fibrous reinforcement only [B29C 70/04](#); combinations of fillers only [B29C 70/58](#); combinations with non reinforcing inserts, e.g. foam blocks, [B29C 70/68](#))}

References

---	----------------------------

Further details of subgroups

[B29C 70/023](#)

Reinforcing inserts, e.g. bars, profiles, local reinforcements other than fibrous

[B29C 70/025](#)

combinations of fibrous reinforcements and filler

B29C 70/04

comprising reinforcements only, e.g. self-reinforcing plastics

Definition statement

This place covers:

heating and fusing of thermoplastic fibres or high aspect ratio elements with high molecular orientation, without the use of a matrix material or with matrix material of the same thermoplastic material as the fibres, yielding a plastic product with anisotropic properties.

Example: heating and compressing of HDPE or PP fibres.

B29C 70/06

Fibrous reinforcements only

Definition statement

This place covers:

This is not a subgroup of self reinforced plastics unlike the title of [B29C 70/04](#) suggests.

This is in fact the head group of fibre reinforced polymers where there is a distinct fibrous reinforcement and a polymer matrix material.

Fig. 1

Fig. 2

B29C 70/18

in the form of a mat, e.g. sheet moulding compound [SMC]

Definition statement

This place covers:

Sheet Molding Compound

SMC is a combination of chopped strands and filled resin in the form of a sheet. Processing SMC by compression molding produces bodywork or structural automotive components and electrical or electronic machine housings in large industrial volumes. The process is also used for other products such as sanitary ware (baths) and urban furniture (stadium and cinema seating). The SMC contains all the components needed to mould the final part (resin, reinforcement, filler, catalyst, low profile additives, etc.) in a malleable and non-tacky sheet. SMC is made from chopped strands sandwiched between two layers of film, onto which the resin paste has already been applied. The SMC passes through a compaction system that ensures complete strand impregnation before being wound into rolls. These are stored for a few days before molding to allow the prepreg to thicken to a moldable viscosity.

B29C 70/20

oriented in a single direction, e.g. roofing or other parallel fibres {([B29C 70/083](#), [B29C 70/226](#) take precedence)}

Definition statement

This place covers:

Examples:

unidirectional preregs, moulding compounds with unidirectional fibres.

Glossary of terms

In this place, the following terms or expressions are used with the meaning indicated:

Warp	collection of fibres in a fabric in the lengthwise machine direction
Tex	indication of the linear weight of a roving, fibre or yarn, 1 Tex = 1 gram/kilometer
Weft or woof fibres	in the transverse direction of the warp fibres, these fibres are shot between warp fibres during the weaving process.

Synonyms and Keywords

In patent documents, the following abbreviations are often used:

Weft = Woof	Fill fibres
-------------	-------------

B29C 70/30

Shaping by lay-up, i.e. applying fibres, tape or broadsheet on a mould, former or core; Shaping by spray-up, i.e. spraying of fibres on a mould, former or core

Definition statement

This place covers:

[B29C 70/30](#) deals with lay-up specific details. Lay-up is the positioning of reinforcements in or on a mould, former, core or substrate taking into account the anisotropy of the material.

Example: the specific lay-up in terms of sequence and or fibre orientation of fibrous reinforcing layers prior to a moulding process.

FIGURE 2

- 50 - Clean as necessary the surface area for application of the patch or doubler.
- 52 - Apply an adhesive to the surface area under the doubler or patch.
- 54 - Position the doubler patch over the surface area.
- 56 - Position the non-gravitational positive pressure generator over the doubler or patch.
- 58 - Adjust the vacuum assemblies to position the non-gravitational positive pressure generator.
- 60 - Apply a vacuum to the vacuum assemblies to secure the generator in the desired position.
- 62 - Position a collapsible diaphragm or bladder in contact with the doubler or patch.
- 64 - Inflate the diaphragm or bladder to apply pressure against the doubler or patch.
- 66 - Maintain the inflated diaphragm or bladder to allow the adhesive to cure.
- 68 - Deflate and remove the diaphragm or bladder.
- 70 - Remove the non-gravitational positive pressure generator.
